

is used. The management device allows applications to write blocks of memory that can read to subsequently release the data back to the system. The development configuration dynamically releases other programs or allows programs to be loaded only the memory space. Memory management is done in 256-byte blocks. The management algorithm is performed in software using 256-bit hardware to be used.

MSF manages the entire addressing range of the system program in memory, code and data areas can be loaded into separate memory blocks.

MSF Support

The system bus (Figures 4-13) connects the board with I/O units. MSF provides application programs with several levels of I/O access. The most basic I/O system call is `IOCHG`. `IOCHG` is a device-independent service that provides buffered I/O for any device in the system. `IOCHG` includes the necessary register calls to control bus access to I/O devices. Standard MSF devices include:

- 1) `CON` - Main console.
- 2) `LPT` - Line printer.
- 3) `TTY` - Alternate console (buffered serial line).
- 4) `CDC` - Mass storage (flexible diskettes, hard disks, etc.).
- 5) `MSL` - "MSL buffer".

MSF also supports a set of user-definable devices. System calls `SETCHG` and `IOCHG` allow a user to add special-purpose device drivers to the system. These drivers enjoy the same overall structure and protection afforded to the standard device drivers. Note that it is not necessary to reprogram the system to add or delete drivers.

Device drivers in MSF are interrupt-driven. Therefore, MSF built in two simple programs that waiting for I/O devices. In addition, `IOCHG` is supported for the `CON` and `TTY` devices.

Machine System Calls

The system also contains routines that are used in applications. Many of these are made available to the user as system calls. The most basic set of these system calls are:

- 1) `PRINTF` - Print a line on the console.
- 2) `PRINTF` - Print a standard error message on the console.
- 3) `CTCWD` - Read a line from the console or from a SUBMIT file.
- 4) `IOCTOW` - Place a text line into a designated volume.
- 5) `IOCTOW` - Place, error check, and reformats a file specification.
- 6) `LOADIN` - Load a binary file into memory.
- 7) `LOADIN` - Allocate and load a text image.

Use of `CTCWD` tells the application program commands from an active SUBMIT file. Parameter substitution is performed automatically for MSF. If there is no active SUBMIT file, `CTCWD` prompts and accepts input from the console. `CTCWD` automatically interprets files and responds to console I/O status. `PRINTF` outputs a standardized error message for any type of MSF I/O. `IOCTOW` places a line of text into a set of volumes. Before `IOCTOW` is usable used to place command lines, it must also be used to place text within an application program. The following tables can be used for the `IOCTOW`.

- 1) `Word` - An alphanumeric string. `IOCTOW` returns the string address and length.
- 2) `Machine` - A decimal or hexadecimal image. `IOCTOW` returns the binary value.
- 3) `Delimiter` - A standard delimiter, such as a comma, a period, a carriage return, etc.
- 4) `Word card` - A word containing "W" or "C".

`IOCTOW` is very useful to any application program that must accept text commands. Finally, `IOCTOW` is a high-level system call that places a file specification and reformats the specification as required for MSF.
