When we raise the flow velocity around a sphere,

The understanding and control of turbulence have been one of the most important problems in fluid dynamics since Leonardo Da Vinci, but it is too difficult to do it.

Quantized Vortex Dynamics and Superfluid Turbulence C.F. Barenghi, R.J. Donnelly, W.F. Vinen, 2001-08-28 This book springs from the programme Quantized Vortex Dynamics and Superfluid Turbulence held at the Isaac Newton Institute for Mathematical Sciences University of Cambridge in August 2000 What motivated the programme was the recognition that two recent developments have moved the study of quantized vorticity traditionally carried out within the low temperature physics and condensed matter physics communities into a new era The first development is the increasing contact with classical fluid dynamics and its ideas and methods For example some current experiments with helium II now deal with very classical issues such as the measurement of velocity spectra and turbulence decay rates The evidence from these experiments and many others is that superfluid turbulence and classical turbulence share many features The challenge is now to explain these similarities and explore the time scales and length scales over which they hold true The observed classical aspects have also attracted attention to the role played by the flow of the normal fluid which was somewhat neglected in the past because of the lack of direct flow visualization Increased computing power is also making it possible to study the coupled motion of superfluid vortices and normal fluids Another contact with classical physics arises through the interest in the study of superfluid vortex connections Reconnections have been studied for some time in the contexts of classical fluid dynamics and magneto hydrodynamics MHD and it is useful to learn from the experience acquired in other fields

superfluid atomic gases vortex laser beams vortex antivortex in ferromagnetic hybrids and optical vortices illumination in chiral nanostructures Also discussions are presented on particle motion in vortex flows on the simulation of vortex dominated flows on vortices in saturable media on achromatic vortices and on ultraviolet vortices Fractal light vortices coherent vortex beams together with vortices in electric dipole radiation and spin wave dynamics in magnetic vortices are examined as well

Transport and Turbulence in Quasi-Uniform and Versatile Bose-Einstein Condensates Gauthier Guillaume, 2020-09-26

Advancing the experimental study of superfluids relies on increasingly sophisticated techniques We develop and demonstrate the loading of Bose Einstein condensates BECs into nearly arbitrary trapping potentials with a resolution improved by a factor of seven when compared to reported systems These advanced control techniques have since been adopted by several cold atoms labs around the world How this BEC system was used to study 2D superfluid dynamics is described In particular negative temperature vortex states in a two dimensional quantum fluid were observed These states were first predicted by Lars Onsager 70 years ago and have significance to 2D turbulence in quantum and classical fluids long range interacting systems and defect dynamics in high energy physics These experiments have established dilute gas BECs as the prototypical system for the experimental study of point vortices and their nonequilibrium dynamics We also developed a new approach to superfluid circuitry based on classical acoustic circuits demonstrating its conceptual and quantitative superiority over previous lumped element models This has established foundational principles of superfluid circuitry that will impact the design of future transport experiments and new generation quantum devices such as atomtronics circuits and superfluid sensors

The Defocusing Nonlinear Schrödinger Equation Panayotis G. Kevrekidis, Dimitri J. Frantzeskakis, Ricardo Carretero-González, 2015-08-04

Bose Einstein condensation is a phase transition in which a fraction of particles of a boson gas condenses into the same quantum state known as the Bose Einstein condensate BEC The aim of this book is to present a wide array of findings in the realm of BECs and on the nonlinear Schrödinger type models that arise therein The Defocusing Nonlinear Schrödinger Equation is a broad study of nonlinear excitations in self defocusing nonlinear media It summarizes state of the art knowledge on the defocusing nonlinear Schrödinger type models in a single volume and contains a wealth of resources including over 800 references to relevant articles and monographs and a meticulous index for ease of navigation
