Quantum Transport In Semiconductors:

Quantum Transport in Semiconductors David K. Ferry, Carlo Jacoboni, 2013-06-29 The majority of the chapters in this volume represent a series of lectures that were given at a workshop on quantum transport in ultrasmall electron devices held at San Miniato Italy in March 1987 These have of course been extended and updated during the period that has elapsed since the workshop was held and have been supplemented with additional chapters devoted to the tunneling process in semiconductor quantum well structures The aim of this work is to review and present the current understanding in nonequilibrium quantum transport appropriate to semiconductors Generally the field of interest can be categorized as that appropriate to inhomogeneous transport in strong applied fields These fields are most likely to be strongly varying in both space and time Most of the literature on quantum transport in semiconductors or in metallic systems for that matter is restricted to the equilibrium approach in which spectral densities are maintained as semiclassical energy conserving delta functions or perhaps incorporating some form of collision broadening through a Lorentzian shape and the distribution functions are kept in the equilibrium Fermi Dirac form The most familiar field of nonequilibrium transport at least for the semiconductor world is that of hot carriers in semiconductors [An Introduction to Quantum Transport in Semiconductors](#)

David K. Ferry, 2017-12-14 Throughout their college career most engineering students have done problems and studies that are basically situated in the classical world Some may have taken quantum mechanics as their chosen field of study This book moves beyond the basics to highlight the full quantum mechanical nature of the transport of carriers through nanoelectronic structures The book is unique in that addresses quantum transport only in the materials that are of interest to microelectronics semiconductors with their variable densities and effective masses The author develops Green's functions starting from equilibrium Green's functions and going through modern time dependent approaches to non equilibrium Green's functions introduces relativistic bands for graphene and topological insulators and discusses the quantum transport changes that these bands induce and discusses applications such as weak localization and phase breaking processes resonant tunneling diodes single electron tunneling and entanglement Furthermore he also explains modern ensemble Monte Carlo approaches to simulation of various approaches to quantum transport and the hydrodynamic approaches to quantum transport All in all the book describes all approaches to quantum transport in semiconductors thus becoming an essential textbook for advanced graduate students in electrical engineering or physics *Quantum Transport in Semiconductor*

Devices DAVID K. ORIOLS FERRY (PROFESSOR XAVIER. WEINBUB, PROFESSOR JOSEF.), Xavier Oriols, Josef

Weinbub, 2023-11-21 This reference text presents a thorough discussion of the interface between quantum mechanics and real world device simulation with an emphasis on the use of particles in the simulation **Quantum Kinetics in Transport**

and Optics of Semiconductors Hartmut Haug, Antti-Pekka Jauho, 2007-12-10 Nanoscale miniaturization and femtosecond laser pulse spectroscopy require a quantum mechanical description of the carrier kinetics that goes beyond the conventional

Boltzmann theory On these extremely short length and time scales the electrons behave as do partially coherent waves This monograph deals with quantum kinetics for transport in low dimensional microstructures and for ultra short laser pulse spectroscopy The nonequilibrium Green function theory is described and used for the derivation of the quantum kinetic equations Numerical methods for the solution of the retarded quantum kinetic equations are discussed and results are presented for high field transport and for mesoscopic transport phenomena Quantum beats polarization decay and non Markovian behaviour are treated for femtosecond spectroscopy on a microscopic basis Since the publishing of the first edition in 1996 the nonequilibrium Green function technique has been applied to a large number of new research topics and the revised edition introduces the reader to many of these areas such as molecular electronics noise calculations build up of screening and polaron correlations and non Markovian relaxation among others Connection to recent experiments is made and it is emphasized how the quantum kinetic theory is essential in their interpretation

Quantum Transport in Semiconductor Nanostructures Tillmann Christoph Kubis, 2009

Physics of Nonlinear Transport in Semiconductors David K. Ferry, John Robert Barker, C. Jacobini, 2012-12-06 The area of high field transport in semiconductors has been of interest since the early studies of dielectric breakdown in various materials It really emerged as a sub discipline of semiconductor physics in the early 1960 s following the discovery of substantial deviations from Ohm s law at high electric fields Since that time it has become a major area of importance in solid state electronics as semiconductor devices have operated at higher frequencies and higher powers It has become apparent since the Modena Conference on Hot Electrons in 1973 that the area of hot electrons has extended well beyond the concept of semi classical electrons or holes in homogeneous semiconductor materials This was exemplified by the broad range of papers presented at the International Conference on Hot Electrons in Semiconductors held in Denton Texas in 1977 Hot electron physics has progressed from a limited phenomenological science to a full fledged experimental and precision theoretical science The conceptual base and subsequent applications have been widened and underpinned by the development of ab initio nonlinear quantum transport theory which complements and identifies the limitations of the traditional semi classical Boltzmann Bloch picture Such diverse areas as large polarons pico second laser excitation quantum magneto transport sub three dimensional systems and of course device dynamics all have been shown to be strongly interactive with more classical hot electron pictures

Electronic Quantum Transport in Mesoscopic Semiconductor Structures Thomas Ihn, 2004-01-08 Opening with a brief historical account of electron transport from Ohm s law through transport in semiconductor nanostructures this book discusses topics related to electronic quantum transport The book is written for graduate students and researchers in the field of mesoscopic semiconductors or in semiconductor nanostructures Highlights include review of the cryogenic scanning probe techniques applied to semiconductor nanostructures

[Theory of Electron Transport in Semiconductors](#) Carlo Jacoboni, 2010-09-05 This book originated out of a desire to provide students with an instrument which might lead them from

knowledge of elementary classical and quantum physics to modern theoretical techniques for the analysis of electron transport in semiconductors. The book is basically a textbook for students of physics, material science and electronics. Rather than a monograph on detailed advanced research in a specific area, it intends to introduce the reader to the fascinating field of electron dynamics in semiconductors, a field that through its applications to electronics greatly contributed to the transformation of all our lives in the second half of the twentieth century and continues to provide surprises and new challenges. The field is so extensive that it has been necessary to leave aside many subjects while others could be dealt with only in terms of their basic principles. The book is divided into five major parts. Part I moves from a survey of the fundamentals of classical and quantum physics to a brief review of basic semiconductor physics. Its purpose is to establish a common platform of language and symbols and to make the entire treatment as far as possible self-contained. Parts II and III respectively develop transport theory in bulk semiconductors in semiclassical and quantum frames. Part IV is devoted to semiconductor structures including devices and mesoscopic coherent systems. Finally, Part V develops the basic theoretical tools of transport theory within the modern nonequilibrium Green function formulation, starting from an introduction to second quantization formalism.
