Artificial intelligence AI offers computational methodologies for modeling systems which can be valuable in understanding networks In this chapter the author examines several types of applications of these methods in exploring how the behavior of individual agents leads to outcomes across networks For example he considers how one system based on a Prisoner's Dilemma that provides a higher payoff for players who don't cooperate can result in a surprising outcome in which cooperation dominates after many rounds of play He also considers agent based models including turtles in a pond showing discrimination effects and sugar and spice trading showing interactions through trading Finally he explores applications to ant colony optimization and swarming optimization of flocks of birds or schools of fish He concludes that computational models offer important insights into networks and the procedures used in modeling have a significant impact The discussion also demonstrates that networks matter affecting outcomes in sometimes unpredictable ways **Crown Landing LNG and Logan Lateral Projects**, 2006 **Santa Rosa Subregional Long-term Wastewater Project**, 1998 **Port Arthur LNG Project**, 2006 **Creativity, Conflict & Controversy** Raymond H.
