Evgenii Borisovich Dynkin, Gary M. Seitz, 2000 Eugene Dynkin is a rare example of a contemporary mathematician who has achieved results in two quite different areas of research algebra and probability In both areas his ideas constitute an essential part of modern mathematical knowledge and form a basis for further development Although his last work in algebra was published in 1955 his contributions continue to influence current research in algebra and in the physics of elementary particles His work in probability is part of both the historical and the modern development of the topic **Modeling**

Uncertainty Moshe Dror, Pierre L'Ecuyer, Ferenc Szidarovszky, 2019-11-05 Modeling Uncertainty An Examination of Stochastic Theory Methods and Applications is a volume undertaken by the friends and colleagues of Sid Yakowitz in his honor Fifty internationally known scholars have collectively contributed 30 papers on modeling uncertainty to this volume Each of these papers was carefully reviewed and in the majority of cases the original submission was revised before being accepted for publication in the book The papers cover a great variety of topics in probability statistics economics stochastic optimization control theory regression analysis simulation stochastic programming Markov decision process application in the HIV context and others There are papers with a theoretical emphasis and others that focus on applications A number of papers survey the work in a particular area and in a few papers the authors present their personal view of a topic It is a book with a considerable number of expository articles which are accessible to a nonexpert a graduate student in mathematics statistics engineering and economics departments or just anyone with some mathematical background who is interested in a preliminary exposition of a particular topic Many of the papers present the state of the art of a specific area or represent original contributions which advance the present state of knowledge In sum it is a book of considerable interest to a broad range of academic researchers and students of stochastic systems **Proceedings of the Seventh Conference on**

Ney,2012-12-06 The purpose of this book is to give a unified treatment of the limit theory of branching processes Since the publication of the important book of T E Harris Theory of Branching Processes Springer 1963 the subject has developed and matured significantly Many of the classical limit laws are now known in their sharpest form and there are new proofs that give insight into the results Our work deals primarily with this decade and thus has very little overlap with that of Harris Only enough material is repeated to make the treatment essentially self contained For example certain foundational questions on the construction of processes to which we have nothing new to add are not developed There is a natural classification of branching processes according to their criticality condition their time parameter the single or multi type particle cases the Markovian or non Markovian character of the process etc We have tried to avoid the rather uneconomical and unenlightening approach of treating these categories independently and by a series of similar but increasingly complicated techniques The basic Galton Watson process is developed in great detail in Chapters I and II Encyclopedia of Library and Information Sciences John D. Eugene Lukacs broad range of research interests This text celebrates the 75th birthday of Eugene Lukacs mathematician teacher and research worker in probability and mathematical statistics This book is organized into two parts encompassing 23 chapters Part I consists of papers in probability theory limit theorems and stochastic processes This part also deals with the continuation and arithmetic of distribution functions the arc sine law Fourier transform methods and nondifferentiability of the Wiener sheet Part II includes papers in information and statistical theories This book will prove useful to statisticians mathematicians and advance mathematics students Dynamic Programming and Optimal Control Dimitri Bertsekas,2012

This is the leading and most up to date textbook on the far ranging algorithmic methodology of Dynamic Programming which can be used for optimal control Markovian decision problems planning and sequential decision making under uncertainty and discrete combinatorial optimization The treatment focuses on basic unifying themes and conceptual foundations It illustrates the versatility power and generality of the method with many examples and applications from engineering operations research and other fields It also addresses extensively the practical application of the methodology possibly through the use of approximations and provides an extensive treatment of the far reaching methodology of Neuro Dynamic Programming Reinforcement Learning Among its special features the book 1 provides a unifying framework for sequential decision making 2 treats simultaneously deterministic and stochastic control problems popular in modern control theory and Markovian decision popular in operations research 3 develops the theory of deterministic optimal control problems including the Pontryagin Minimum Principle 4 introduces recent suboptimal control and simulation based approximation techniques neuro dynamic programming which allow the practical application of dynamic programming to complex problems that involve the dual curse of large dimension and lack of an accurate mathematical model 5 provides a comprehensive treatment of infinite horizon problems in the second volume and an introductory treatment in the first volume The electronic version of the book includes 29 theoretical problems with high quality solutions which enhance the range of coverage of the book **Athens**

Random Walks Allan Gut,2013-04-17 My first encounter with renewal theory and its extensions was in 1967 68 when I took a course in probability theory and stochastic processes where the then recent book Stochastic Processes by Professor N D Prabhu was one of the requirements Later my teacher Professor Carl Gustav Esseen gave me some problems in this area for a possible thesis the result of which was Gut 1974a Over the years I have on and off continued research in this field During this time it has become clear that many limit theorems can be obtained with the aid of limit theorems for random walks indexed by families of positive integer valued random variables typically by families of stopping times During the spring semester of 1984 Professor Prabhu visited Uppsala and very soon got me started on a book focusing on this aspect I wish to thank him for getting me into this project for his advice and suggestions as well as his kindness and hospitality during my stay at Cornell in the spring of 1985 Throughout the writing of this book I have had immense help and support from Svante Janson He has not only read but scrutinized every word and every formula of this and earlier versions of the manuscript My gratitude to him for all the errors he found for his perspicacious suggestions and remarks and above all for what his unusual personal as well as scientific generosity has meant to me cannot be expressed in words
