Modelling Autonomic Communication

Environments Rob Brennan, Joel Fleck II, Sven van der Meer, 2010-10-19

We are delighted to present the proceedings of the 5th International Workshop on Modeling Autonomic Communication

Environments MACE 2010 This workshop was held as part of the 6th International Conference on Network and Service Management CNSM 2010 formerly known as and building on the success of the MANWEEK conference series This year we met just a hundred yards away from Niagara Falls in Canada a very exciting location MACE started as an experiment and over the past years has created a small yet very active community that convened again this year to discuss and evaluate new advances innovative ideas and solid developments The main focus of MACE combining modeling with communications is certainly a hard topic that requires a lot of discussion thus the work presented at the workshop is intrinsically debatable and might not be as practiced as in other well established workshops but this was the nature of MACE from the beginning New ideas sometimes more sometimes less rough around the edges and some of them even inside are submitted and provoke extensive discussions The field in which we are working relies on these discussions or even adventures and we have this year again strongly motivated and supported a variety of novel work in the technical program This year the submissions while being closely related to the main themes brought some new areas into the workshop We still see architectural design and the application of autonomic principles to networks and services but we also now have submissions looking into previously unexplored areas such as Home Area Networks multimedia streaming virtualization federation and user experience This portrays a maturity in the domain which has by now gone through several cycles and improves its outputs by applying the lessons learned

Comparative Metric Semantics of Programming Languages Franck van Breughel, 2012-12-06 During the last three decades several different styles of semantics for programming languages have been developed This book compares two of

them the operational and the denotational approach On the basis of several examples we show how to define operational and denotational semantic models for programming languages Furthermore we introduce a general technique for comparing various semantic models for a given language We focus on different degrees of nondeterminism in programming languages Nondeterminism arises naturally in concurrent languages It is also an important concept in specification languages In the examples discussed the degree of nondeterminism ranges from a choice between two alternatives to a choice between a collection of alternatives indexed by a closed interval of the real numbers The former arises in a language with nondeterministic choices A real time language with dense choices gives rise to the latter We also consider the nondeterministic random assignment and parallel composition both couched in a simple language Besides nondeterminism our four example languages contain some form of recursion a key ingredient of programming languages Distributed, Ambient, and Pervasive Interactions Norbert Streitz, Constantine Stephanidis, 2013-07-02 This book constitutes the refereed proceedings of the 5th International Conference on Distributed Ambient and Pervasive Interactions DAPI 2013 held as part of the 15th International Conference on Human Computer Interaction HCII 2013 held in Las Vegas USA in July 2013 jointly with 12 other thematically similar conferences The total of 1666 papers and 303 posters presented at the HCII 2013 conferences was carefully reviewed and selected from 5210 submissions These papers address the latest research and development efforts and highlight the human aspects of design and use of computing systems The papers accepted for presentation thoroughly cover the entire field of human computer interaction addressing major advances in knowledge and effective use of computers in a variety of application areas The total of 54 contributions was carefully reviewed and selected for inclusion in the DAPI proceedings The papers are organized in the following topical sections natural interaction context awareness in smart and intelligent environments design and evaluation of smart and intelligent environments smart cities multi user group and collaborative interaction smart everyday living and working environments **Catalog of the Communications Library, University of Illinois** University of Illinois at Urbana-Champaign. Organizations as Complex Systems Maurice Yolles, 2006-09-01 Managing the Complex is an ambitious title and it would be an audacious one if we were not to begin with a frank admission to date few to none of us have a skill set which includes managing the complex We try various things we write about others and we wonder about still others When a tool perspective or technique comes along which seems to evoke success we emulate it probe it and recoil at the all too often admission that it was situation and context which afforded success its opportunity and not some quality intrinsic to the tool perspective or technique Indeed if the study of complexity has done anything for managers and for those who espouse managerial theory it is in providing a scientific foundation for the notion that context matters Those who preach abstract ideas have then to reconcile themselves to the notion that situation and embodiment matters Those who believe in strong causality and determinism are left to wrestle with the role of chance uncertainty and chaos Those who prefer to argue that

men move history are confronted with the role of environment and affordances while those who argue the reverse are left to contend with charisma irrationality of crowds and the strange qualities we know as emotions A series on complex systems has less ambitious goals to contend with than this Such a series can deal with classifications and categories and speak of noise as if it were not the central focus of the problem Managing the complex is about managing noise or perhaps we should say it is about dealing with accepting making room for and learning from noise The articles in this volume and in volumes to come will each be considered as noise by some and as gems by others but we hope that practicing managers and academics alike will find plenty of fuel to drive their personal explorations into understanding and perhaps even managing the complex
