Machines that Learn to Play Games Johannes Fürnkranz, Miroslav Kubat, 2001 The mind set that has dominated the history of computer game playing relies on straightforward exploitation of the available computing power The fact that a machine can explore millions of variations sooner than the sluggish human can wink an eye has inspired hopes that the mystery of intelligence can be cracked or at least side stepped by sheer force Decades of the steadily growing strength of computer programs have attested to the soundness of this approach It is clear that deeper understanding can cut the amount of necessary calculations by orders of magnitude The papers collected in this volume describe how to instill learning skills in game playing machines The reader is asked to keep in mind that this is not just about games the possibility that the discussed techniques will be used in control systems and in decision support always looms in the background

From Literature to Biterature Peter Swirski, 2013-10-01 From Literature to Biterature is based on the premise that in the foreseeable future computers will become capable of creating works of literature Among hundreds of other questions it considers Under which conditions would machines become capable of creative writing Given that computer evolution will exceed the pace of natural evolution a million fold what will such a state of affairs entail in terms of art culture social life and even nonhuman rights Drawing a map of impending literary cultural social and technological revolutions Peter Swirski boldly assumes that computers will leap from mere syntax driven processing to semantically rich understanding He argues that acknowledging biterature as a species of literature will involve adopting the same range of attitudes to computer authors computhows as to human ones and that it will be necessary to approach them as agents with internal states and creative

intentions Ranging from the metafiction of Stanislaw Lem to the Turing test familiar to scientists working in Artificial Intelligence and the philosophers of mind to the evolutionary trends of culture and machines Swirski's scenarios lay the groundwork for a new area of study on the cusp of literary futurology evolutionary cognition and philosophy of the future

Telexistence (2nd Edition) Susumu Tachi, 2014-12-04 Telexistence is a fundamental concept which refers to the general technology that enables a human being to have the real time sensation of being at a place other than where he or she actually exists while being able to interact with the remote environment which may be real virtual or a combination of both It also refers to an advanced type of teleoperation system that enables an operator at the control to perform remote tasks dexterously with the feeling of existing in a surrogate robot working in a remote environment Telexistence in the real remote environment through a virtual environment is also possible This book is the second edition of the original Telexistence new contents cover recent advancements of the technology in areas such as human augmentation autostereoscopy tangible visuo haptic 3D display face to face communication and haptic sensations and technologies Case studies of the mobile mutual telexistence system TELESAR IV and haptic telexistence avatar system TELESAR V are also included Written by the inventor of the concept of this emerging technology it introduces the concept of telexistence explains how this concept can be realized illustrates precisely real examples of the realization of the concept and determines its future advancement Readers will be inspired by the concept and acquire appropriate knowledge on this emerging technology and the fundamental skills to contribute in further development of telexistence

The BOXES Methodology Second Edition David W. Russell, 2021-11-18 This book focuses on how the BOXES Methodology which is based on the work of Donald Michie is applied to ill defined real time control systems with minimal a priori knowledge of the system The method is applied to a variety of systems including the familiar pole and cart This second edition includes a new section that covers some further observations and thoughts problems and evolutionary extensions that the reader will find useful in their own implementation of the method This second edition includes a new section on how to handle jittering about a system boundary which in turn causes replicated run times to become part of the learning mechanism It also addresses the aging of data values using a forgetfulness factor that causes wrong values of merit to be calculated Another question that is addressed is Should a BOXES cell ever be considered fully trained and if so excluded from further dynamic updates Finally it expands on how system boundaries may be shifted using data from many runs using an evolutionary paradigm

Philosophy of Psychology and Cognitive Science, 2006-10-23 Psychology is the study of thinking and cognitive science is the interdisciplinary investigation of mind and intelligence that also includes philosophy artificial intelligence neuroscience linguistics and anthropology In these investigations many philosophical issues arise concerning methods and central concepts The Handbook of Philosophy of Psychology and Cognitive Science contains 16 essays by leading philosophers of science that illuminate the nature of the theories and explanations used in the investigation of minds Topics discussed include representation mechanisms reduction

perception consciousness language emotions neuroscience and evolutionary psychology Comprehensive coverage of philosophy of psychology and cognitive science Distinguished contributors leading philosophers in this area Contributions closely tied to relevant scientific research Superintelligence Nick Bostrom, 2014-07-02 The human brain has some capabilities that the brains of other animals lack It is to these distinctive capabilities that our species owes its dominant position Other animals have stronger muscles or sharper claws but we have cleverer brains If machine brains one day come to surpass human brains in general intelligence then this new superintelligence could become very powerful As the fate of the gorillas now depends more on us humans than on the gorillas themselves so the fate of our species then would come to depend on the actions of the machine superintelligence But we have one advantage we get to make the first move Will it be possible to construct a seed AI or otherwise to engineer initial conditions so as to make an intelligence explosion survivable How could one achieve a controlled detonation To get closer to an answer to this question we must make our way through a fascinating landscape of topics and considerations Read the book and learn about oracles genies singletons about boxing methods tripwires and mind crime about humanity's cosmic endowment and differential technological development indirect normativity instrumental convergence whole brain emulation and technology couplings Malthusian economics and dystopian evolution artificial intelligence and biological cognitive enhancement and collective intelligence This profoundly ambitious and original book picks its way carefully through a vast tract of forbiddingly difficult intellectual terrain Yet the writing is so lucid that it somehow makes it all seem easy After an utterly engrossing journey that takes us to the frontiers of thinking about the human condition and the future of intelligent life we find in Nick Bostrom's work nothing less than a reconceptualization of the essential task of our time Artificial Intelligence Rainer Born, 2018-05-15 The purpose of this book originally published in 1987 was to contribute to the advance of artificial intelligence AI by clarifying and removing the major sources of philosophical confusion at the time which continued to preoccupy scientists and thereby impede research Unlike the vast majority of philosophical critiques of AI however each of the authors in this volume has made a serious attempt to come to terms with the scientific theories that have been developed rather than attacking superficial straw men which bear scant resemblance to the complex theories that have been developed For each is convinced that the philosopher's responsibility is to contribute from his own special intellectual point of view to the progress of such an important field rather than sitting in lofty judgement dismissing the efforts of their scientific peers The aim of this book is thus to correct some of the common misunderstandings of its subject The technical term Artificial Intelligence has created considerable unnecessary confusion because of the ordinary meanings associated with it and for that very reason the term is endlessly misused and abused The essays collected here all aim to expound the true nature of AI and to remove the ill conceived philosophical discussions which seek answers to the wrong questions in the wrong ways Philosophical discussions and decisions about the proper use of AI need to be based on a proper understanding of the manner in which AI scientists achieve their results in

particular in their dependence on the initial planning input of human beings The collection combines the Anglo Saxon school of analytical philosophy with scientific and psychological methods of investigation The distinguished authors in this volume represent a cross section of philosophers psychologists and computer scientists from all over the world The result is a fascinating study in the nature and future of AI written in a style which is certain to appeal and inform laymen and specialists alike

Intelligent Vision Systems for Industry Bruce G. Batchelor, Paul F. Whelan, 2012-12-06 The application of intelligent imaging techniques to industrial vision problems is an evolving aspect of current machine vision research Machine vision is a relatively new technology more concerned with systems engineering than with computer science and with much to offer the manufacturing industry in terms of improving efficiency safety and product quality Beginning with an introductory chapter on the basic concepts the authors develop these ideas to describe intelligent imaging techniques for use in a new generation of industrial imaging systems Sections cover the application of AI languages such as Prolog the use of multi media interfaces and multi processor systems external device control and colour recognition The text concludes with a discussion of several case studies that illustrate how intelligent machine vision techniques can be used in industrial applications

Object Recognition M. Bennamoun, G.J. Mamic, 2001-12-12 Automatic object recognition is a multidisciplinary research area using concepts and tools from mathematics computing optics psychology pattern recognition artificial intelligence and various other disciplines The purpose of this research is to provide a set of coherent paradigms and algorithms for the purpose of designing systems that will ultimately emulate the functions performed by the Human Visual System HVS Hence such systems should have the ability to recognise objects in two or three dimensions independently of

their positions orientations or scales in the image The HVS is employed for tens of thousands of recognition events each day ranging from navigation through the recognition of landmarks or signs right through to communication through the recognition of characters or people themselves Hence the motivations behind the construction of recognition systems which have the ability to function in the real world is unquestionable and would serve industrial e g quality control military e g automatic target recognition and community needs e g aiding the visually impaired Scope Content and Organisation of this Book This book provides a comprehensive yet readable foundation to the field of object recognition from which research may be initiated or guided It represents the culmination of research topics that I have either covered personally or in conjunction with my PhD students These areas include image acquisition 3 D object reconstruction object modelling and the matching of objects all of which are essential in the construction of an object recognition system **Scalable Search in Computer**
