Quantitative Dynamic Plant Ecology 2nd Edition:

Quantitative and dynamic plant ecology ,1974 Ecology, Environmental Science and Conservation 2nd Edition JS Singh | SP Singh | SR Gupta | Rishikesh Singh, The updated second edition of the book offers an innovative synthesis of fundamental ecological concepts and practical applications in environmental science and conservation It is the first textbook on the subject by eminent Indian researchers and presents most of the examples from the Indian subcontinent The book covers a wide range of topics including fundamental concepts required to comprehend the physical environment population dynamics community characteristics patterns and gradients in biodiversity ecosystem functioning and dynamics and the study of biogeography It also addresses applied topics such as environmental pollution impact assessment natural resource management biodiversity conservation ecosystem services global climate change ecosystem restoration urban ecology and sustainable development The main issues are discussed within the sustainability framework considering humans as part of ecosystems and recognising that sustainable development requires the integration of ecology with social sciences for policy formulation and implementation The updated edition of the book aligns with the National Education Policy 2020 and the revised UGC Guidelines It aims to meet the needs of students in basic and multidisciplinary courses in ecology and environmental science as well as professionals in agriculture forestry and geography at both the graduate and postgraduate levels

Competition P.A. Keddy,2012-12-06 Competition is one of the most important factors controlling the distribution and abundance of living creatures Sperm cells racing up reproductive tracts beetle larvae battling inside single seeds birds defending territories and trees interfering with the light available to neighbours are all engaged in competition for limited resources Along with predation and mutualism competition is one of the three major biological forces that assemble living communities Recent experimental work much of it only from the last few decades has enhanced human knowledge of the prevalence of competition in nature There are acacia trees that use ants to damage vines beetles that compete in arenas for access to dung balls tadpoles that apparently poison their neighbours birds that smash the eggs of potential competitors and plants that associate with fungi in order to increase access to soil resources While intended as an up to date reference work on the state of this branch of ecology the many non technical examples will make interesting reading for those with a general interest in nature Greatly expanded from the first prize winning edition there are entirely new chapters including one on resources and another on competition gradients in nature The author freely ranges across all major taxonomic groups in search of evidence The question of whether competition occurs is no longer useful the author maintains rather the challenge is to determine when and where each kind of competition is important in natural systems For this reason variants of competition such as intensity asymmetry and hierarchies are singled out for particular attention The book concludes with the difficulties of finding general principles in complex ecological communities and illustrates the limitations on knowledge that arise out of the biased conduct of scientists themselves Competition can be found elsewhere in living systems other than

ecological communities at sub microscopic scales in the interactions of enzymes and neural pathways and over large geographic areas in the spread of human populations and contrasting ideas about the world Human societies are therefore also examined for evidence of the kinds of competition found among other living organisms Using an array of historical examples including Biblical conflicts the use of noblemen's sons in the Crusades the Viking raids in Europe strategic bombing campaigns in the Second World War and ethnic battles of the Balkans the book illustrates how most of the aspects of competition illustrated with plants and animals can be extended to the interactions of human beings and their societies

Lakes and Water Management V. Ilmavirta, R.I. Jones, P.-E. Persson, 2012-12-06 Multiple use of natural waters and watersheds poses many practical problems some of which are clearly limnological relating for example to carrying capacities of lakes deterioration of water quality and fisheries management It is thus important to consider limnological aspects when making decisions in the field of water management To further this attitude the Finnish Limnological Society considered Lakes and Water Management to be a suitable theme for the Society's Jubilee Symposium held in Helsinki on 22-23 September 1980 at the Viikki Campus of the University of Helsinki to mark the Society's 30th Anniversary The Finnish Limnological Society has arranged national limnological symposia every one or two years The papers presented at these symposia have been published in the series Limnological Symposium in Finnish or Swedish with short summaries in an internationally spoken language Due to financial difficulties the series was terminated as of the symposium in 1979 When preparing the 30th Anniversary of the Finnish Limnological Society the Governing Board of the Society decided to arrange an international symposium on a theme relevant to modern limnology both in Finland and elsewhere The selected results of the successful meeting on lakes and water management which was attended by 220 people from 7 countries are presented in this volume

The Biology of Marine Plants M. J. Dring, 1992 This book provides an introduction to recent analytical and experimental studies of plant growth in the sea The physiology and ecology of marine plants are therefore emphasized

Positive Plant Interactions and Community Dynamics Francisco Pugnaire, 2010-02-09 Ever since the concept of the struggle for life became the heart of Darwin's theory of evolution biologists have studied the relevance of interactions for the natural history and evolution of organisms Although positive interactions among plants have traditionally received little attention there is now a growing body of evidence showing the effect of positive interactions

Ecological Methods T.R. Southwood, 2013-06-29 The virtual impossibility of extracting the many different species from a habitat with equal efficiency by a single method e.g. Nef 1960 1 1 Population estimates Population estimates can be classified into a number of different types the most convenient classification is that adopted by Morris 1955 although he used the terms somewhat differently in a later paper 1960 1 1 1 Absolute and related estimates The animal numbers may be expressed as a density per unit area of the ground of the habitat Such estimates are given by nearest neighbour and related techniques Chapter 2 marking and recapture Chapter 3 by sampling a known fraction of the habitat Chapter 4 6 and by removal sampling and random walk techniques Chapter 7

Absolute population The number of animals per unit area e g hectare acre It is almost impossible to construct a budget or to study mortality factors without the conversion of population estimates to absolute figures for not only do insects often move from the plant to the soil at different developmental stages but the amount of plant material is itself always changing The importance of obtaining absolute estimates cannot be overemphasized
