## ABSTRACT

We investigate the Cauchy problem for the focusing inhomogeneous nonlinear Schrödinger equation  $i\partial_t u + \Delta u = -|x|^b |u|^{p-1} u$  in the radial Sobolev space  $H^1_b(\mathbb{R}^N)$ , where  $b > 0$  and  $p > 1$ . We show the global existence and energy scattering in the intercritical regime, i.e.,  $p > \frac{N+1+2b}{N-2}$  and  $p < \frac{N+1+2b}{N-2}$  if  $N \geq 3$ . We also obtain blowing-up solutions for the mass-critical and mass-supercritical nonlinearities. The main difficulty, coming from the spatial growing nonlinearity, is overcome by refined Gagliardo–Nirenberg-type inequalities. Our proofs are based on improved Gagliardo–Nirenberg inequalities, the Morawetz–Sobolev approach of Dodson and Murphy [Proc. Am. Math. Soc. 145(11), 4859–4867 (2017)], radial Sobolev embeddings, and localized virial estimates.

## 1. INTRODUCTION

In this paper, we consider the Cauchy problem for the following focusing inhomogeneous nonlinear Schrödinger equation:

$$i\partial_t u + \Delta u = -|x|^b |u|^{p-1} u, \quad (t, x) \in \mathbb{R}_+ \times \mathbb{R}^N, \quad (1.1)$$

where  $b > 0$  and  $p > 1$ . Equation (1.1) is a special case of a more general inhomogeneous nonlinear Schrödinger equation given by

$$i\partial_t u + \Delta u = K(x) |u|^{p-1} u, \quad (1.2)$$

which arises in various physical contexts such as the propagation of a laser beam and plasma waves. Here,  $u$  is the electric field in laser optics and  $K$  is proportional to the electric density.<sup>1,2</sup> For  $p = 3$ , Eq. (1.1) can be viewed as a model of dilute Bose–Einstein condensate when the two-body interactions of the condensate are considered.

The Cauchy problem for (1.2) was first investigated by Merle<sup>3</sup> who proves the existence of blow-up solutions in the mass-critical regime and under some assumptions on  $K$  including in particular  $k_1 \leq K(x) \leq k_2$  with  $k_1, k_2$  being positive constants. Later on, the stability of standing waves was studied in Refs. 7 and 8 for  $K(x) = K(|x|)$  with  $K \in C^2(\mathbb{R}^N) \cap L^\infty(\mathbb{R}^N)$ ,  $\epsilon > 0$  small, and  $p \geq 1 + \frac{2}{N}$ . Recently, the Cauchy problem

the Italian Ministry of Scientific and Technological Research and the Regional Sicilian Government Many of the fundamental problems of this subject go back to Poincare and have been recognized in recent years as being of basic importance in a variety of physical contexts stability of orbits in accelerators and in plasma and galactic dynamics occurrence of chaotic motions in the excitations of solids etc This period of intense interest on the part of physicists followed nearly a half a century of neglect in which research in the subject was almost entirely carried out by mathematicians It is an indication of the difficulty of some of the problems involved that even after a century we do not have anything like a satisfactory solution

Sifton, Paul Weinacht, 2008 The prediction of the dynamic stability derivatives roll damping Magnus and pitch damping moments were evaluated for three spin stabilized projectiles using steady state computational fluid dynamic CFD calculations Roll damping CFD predictions were found to be very good across the Mach number range investigated Magnus moment predictions were very good in the supersonic flight regime however the accuracy varied in the subsonic and transonic flight regime The best Magnus moment prediction in the subsonic flight regime was for the square base projectile that did not exhibit highly nonlinear Magnus moments A primary contribution of this report is the demonstration that the pitch damping moment can be adequately predicted via steady state methods rather than resorting to unsteady techniques The predicted pitch damping moment compared very well to experimental data for the three projectiles investigated For one configuration the pitch damping moment was predicted by several CFD codes two different steady state methods and a time accurate planar pitching motion method All methods compared very well to each other and to the experimental data *Literature 1976, Part 1* S. **Applied Symbolic Dynamics And Chaos (Second Edition)** Hao Bailin, Zheng Wei-mou, 2018-05-11 Symbolic dynamics is a coarse grained description of dynamics It has been a long studied chapter of the mathematical theory of dynamical systems but its abstract formulation has kept many practitioners of physical sciences and engineering from appreciating its simplicity beauty and power At the same time symbolic dynamics provides almost the only rigorous way to understand global systematics of periodic and especially chaotic motion in dynamical systems In a sense everyone who enters the field of chaotic dynamics should begin with the study of symbolic dynamics However this has not been an easy task for non mathematicians On one hand the method of symbolic dynamics has been developed to such an extent that it may well become a practical tool in studying chaotic dynamics both on computers and in laboratories On the other hand most of the existing literature on symbolic dynamics is mathematics oriented This book is an attempt at partially filling up this apparent gap by emphasizing the applied aspects of symbolic dynamics without mathematical rigor
