Management of Concrete Structures for Long-term Serviceability Ewan A. Byars, Tony McNulty, 1997 This book presents the proceedings of the international seminar organised by the Centre for Cement and Concrete at the University of Sheffield to bring together information on the major issues concerning through life management of major concrete structures

Long-term Serviceability of Concrete Structures, 1989 **Serviceability Limit State of Concrete Structures** FIB - International Federation for Structural Concrete, 2019-09-01 Serviceability limit states are essential for appropriate function and durability of concrete structures The attention is paid especially to the stress limitation crack width analysis and deflection analysis The document provides supplementary information to the fib Model Code 2010 MC2010 where a limited space did not allow for a detailed description of individual procedures The principles used in MC2010 in chapter 7.6 are explained in detail within this document The stress analysis is focused on stresses in concrete and steel including the stress redistribution due to the long term load and cracking of reinforced concrete and prestressed concrete elements Crack width analysis explains the mechanism of cracking under mechanical loading and due to deformation restraint Cracks in prestressed concrete elements are also discussed Deflection analyses with different levels of accuracy are described including the shear effects Examples illustrate the practical application of rules defined in the MC2010 of individual serviceability limit states Simplified and more general methods are used An important part of the bulletin shows the development and extension of the serviceability limit states after publishing of the MC2010 and alternative approaches Special attention is paid to deflections of prestressed concrete beams shear effects on deflection slenderness limits and influence of the concrete cover The final part deals with an application of numerical simulations **Long Term Durability of Structural Materials** P.J.M. Monteiro, K.P. Chong, J. Larsen-Basse, K. Komvopoulos, 2001-08-29 Long Term Durability of Structural Materials features proceedings of the workshop held at Berkeley CA in October 2000 It brought together engineers and scientists who have received grants from the initiative NSF 98 42 to share their results on the study of long term durability of materials and structures The major objective was to develop new methods for accelerated short term laboratory or in situ tests which allow accurate reliable predictions of the long term performance of materials machines and structures To achieve this goal it was important to understand the fundamental nature of the deterioration and damage processes in materials and to develop innovative ways to model the behavior of these processes as they affect the life and long term performance of components machines and structures The researchers discussed their approach to include size effects in scaling up from laboratory specimens to actual structures Accelerated testing and durability modeling techniques developed were validated by comparing their results with performance under actual operating conditions The main

mechanism of the deterioration discussed included environmental effects and or exposure to loads speeds and other operating conditions that are not fully anticipated in the original design A broad range of deterioration damage such as fatigue overload ultraviolet damage corrosion and wear was presented A broad range of materials of interest was also discussed including the full spectrum of construction materials metals ceramics polymers composites and coatings Emphasis was placed on scale dependence and history of fabrication on resulting mechanical behavior of materials

Durability of Building Materials and Components J.M. Baker, Howard Davies, A.J. Majumdar, H. Davies, P.J. Nixon, 2006-05-18 This book is the Proceedings of the fifth in the major series of triennial international conferences on the Durability of Building Materials and Components It includes reports on current research into the causes mechanisms and rates of deterioration of building materials reliable means of repair and prevention of early failure and new materials which can reduce construction costs

Short-Term and Long-Term Behaviour of Reinforced Self-Compacting Concrete Structures Farhad Aslani, 2014-06-24 Volume is indexed by Thomson Reuters BCI WoS Self Compacting Concrete SCC refers to a highly flow able non segregating concrete that can be spread into place fill the

formwork and encapsulate the reinforcement without the aid of any mechanical consolidation SCC is regarded as one of the most promising developments in concrete technology due to significant advantages over Conventional Concrete CC In this study cracking caused by external loads in reinforced SCC and FRSCC slabs is examined experimentally and analytically The mechanisms associated with the flexural cracking due to the combined effects of constant sustained service loads and shrinkage are observed One of the primary objectives of this study is to develop analytical models that accurately predict the hardened mechanical properties of SCC and FRSCC Subsequently these models have been successfully applied to simulate time dependent cracking of SCC and FRSCC one way slabs

Mechanisms of Chemical Degradation of Cement-based Systems K.L. Scrivener, J.F. Young, 1997-04-17 Deterioration of cement based materials is a continuing problem as it results in the substantial shortening of the lives of conventional concrete structures The main costs result from poor performance and the need for early repair With more advanced applications where very long service lives are essential such as the storage of nuclear waste an understanding of the degradation processes in order to predict long term performance is very important this book forms the proceedings of the latest Symposia at the Materials Research Society Autumn meeting in Boston
