Application of Muscle/Nerve Stimulation in Health and Disease Gerta Vrbová, Olga Hudlická, Kristin Schaefer Centofanti, 2008-04-19 The first evidence that electrical changes can cause muscles to contract was provided by Galvani 1791. Galvani's ideas about

animal electricity were explored during the 19th and 20th century when it was firmly established that electricity is one of the most important mechanisms used for communication by the nervous system and muscle. These researches lead to the development of ever more sophisticated equipment that could either record the electrical changes in nerves and muscles or elicit functional changes by electrically stimulating these structures. It was indeed the combination of these two methods that elucidated many of the basic principles about the function of the nervous system. Following these exciting findings it was discovered that electrical stimulation and the functions elicited by it also lead to long term changes in the properties of nerves and particularly muscles. Recent findings help us to understand the mechanisms by which activity induced by electrical stimulation can influence mature fully differentiated cells in particular muscles, blood vessels and nerves. Electrically elicited activity determines the properties of muscle fibres by activating a sequence of signalling pathways that change the gene expression of the muscle. Thus electrical activity graduated from a simple mechanism that is used to elicit muscle contraction to a system that could induce permanent changes in muscles and modify most of its characteristic properties.
