Selected Papers of Robert S. Mulliken Robert S. Mulliken, 1975-08 This book brings together in one volume the most important papers of Robert S Mulliken who was awarded the 1966 Nobel Prize in chemistry for his seminal work on chemical bonds and the electronic structures of molecules The papers collected here range from suggestive to closely detailed analyses of various topics in the theory of spectra and electronic structure of diatomic and polyatomic molecules Professor Mulliken has written introductory commentaries on each of the volume s seven parts Included in the volume are essays of general as well as scientific interest they are grouped under thematic headings Part I contains those papers which are of historical significance An autobiographical piece by Dr Mulliken offers a glimpse of the many famous people whom he has known Also reprinted is the text of his Nobel Prize acceptance speech At the end is a list of his students and other co workers and a complete bibliography of his papers Part II includes Mulliken s work on band spectra and chemistry as well as his research on the assignment of quantum numbers for electrons in molecules Part III surveys the author s early work on the bonding power of electrons and the method of molecular orbitals Included is a discussion of the structure and spectra of a number of important types of molecules The papers in part IV focus on the intensities of electronic transitions in molecular spectra This incorporates Mulliken s work on charge transfer and the halogen molecule spectra The problems addressed in part V center on the spectra and structure of polyatomic molecules Reprinted here is a report which Mulliken prepared on notation for polyatomic molecules Part VI is devoted to the problem of hyperconjugation These papers develop and apply the concept of hyperconjugation and explore its relation to the concept of conjugation The last part offers some of the most important papers from the author s postwar publications The central focus is on molecular orbital theory the area in which Mulliken s Nobel winning discoveries were made **Tools and Modes of Representation in the Laboratory Sciences** U. Klein, 2013-04-17 constitutive of reference in laboratory sciences as cultural sign systems and their manipulation and superposition collectively shared classifications and associated conceptual frameworks and various forms of collective action

and social institutions This raises the question of how much modes of representation and specific types of sign systems mobilized to construct them contribute to reference Semioticians have argued that sign systems are not merely passive media for expressing preconceived ideas but actively contribute to meaning Sign systems are culturally loaded with meaning stemming from previous practical applications and social traditions of applications In new local contexts of application they not only transfer stabilized meaning but also can be used as active resources to add new significance and modify previous meaning This view is supported by several analyses presented in this volume Sign systems can be implemented like tools that are manipulated and superposed with other types of signs to forge new representations The mode of representation made possible by applying and manipulating specific types of representational tools such as diagrammatic rather than mathematical representations or Berzelian formulas rather than verbal language contributes to meaning and forges fine grained differentiations between scientists concepts Taken together the essays contained in this volume give us a multifaceted picture of the broad variety of modes of representation in nineteenth century and twentieth century laboratory sciences of the way scientists juxtaposed and integrated various representations and of their pragmatic use as tools in scientific and industrial practice
