**Summary.** This article provides an introduction to the representation theory of Banach–Lie groups of operators on Hilbert spaces, where our main focus lies on highest weight representations and their geometric realization as spaces of holomorphic sections of a complex line bundle. After discussing the finite-dimensional case in Section I, we describe the algebraic side of the theory in Sections II and III. Then we turn in Sections IV and V to Banach–Lie groups and holomorphic representations of complex classical groups. The geometry of the coadjoint action is discussed in Section VI, and in the concluding Section VII all threads lead to a full discussion of the theory for the group  $U_2(H)$  of unitary operators  $u$  on a Hilbert space  $H$  for which  $u - 1$  is Hilbert–Schmidt.

## Introduction

As in finite dimensions, Lie theory is an exciting combination of algebraic and analytic methods. In the finite-dimensional situation one studies a connected Lie group  $G$  by the exponential function  $\exp: \mathfrak{g} \rightarrow G$  which is a local diffeomorphism. Therefore the Lie algebra structure of  $\mathfrak{g}$  carries essentially all the local information on  $G$ . This means that all groups with the same Lie algebra  $\mathfrak{g}$  are quotients of an essentially unique simply connected group  $\tilde{G}$  modulo discrete central subgroups. Viewing  $\mathfrak{g}$  as a “linearization” of  $G$ , the heart of the Lie-theoretic methods is a dictionary translating analytic and global properties of  $G$  into algebraic properties of its Lie algebra  $\mathfrak{g}$ , which are then studied by algebraic methods.

This picture is different for infinite-dimensional groups, and how bad it becomes depends on the setting one is working in. The central objects of this article will be groups of operators on Hilbert spaces. These groups will always have a natural topology for which they are Banach–Lie groups, i.e., manifolds modeled on a Banach space endowed with a smooth group structure (multiplication and inversion). In this setting, one still has an exponential function  $\exp: \mathfrak{g} \rightarrow G$  which is a local diffeomorphism, hence a good translation mechanism from  $G$  to  $\mathfrak{g}$  and back. A new feature is that the Lie algebra  $\mathfrak{g}$  now is a Banach space with a continuous Lie bracket, a Banach–Lie algebra, so that we need functional analytic as well as algebraic concepts to study the Lie algebra and the group.

## **Representations Of Infinite Dimensional Groups:**

**Representations of Infinite-dimensional Groups** Rais Salmanovich Ismagilov, 1996 This book is devoted to representations of two classes of infinite dimensional groups current groups and diffeomorphism groups The author presents a complete treatment of the subject including general methods for constructing irreducible representations of infinite dimensional groups and general results about such representations He also exhibits deep relations between representations of infinite dimensional groups and the theory of Fock spaces the theory of point random processes and other branches of mathematics *Infinite Dimensional Groups and Algebras in Quantum Physics* Johnny T. Ottesen, 1995-04-18 The idea of writing this book appeared when I was working on some problems related to representations of physically relevant infinite dimensional groups of operators on physically relevant Hilbert spaces The considerations were local reducing the subject to dealing with representations of infinite dimensional Lie algebras associated with the associated groups There is a large number of specialized articles and books on parts of this subject but to our surprise only a few represent the point of view given in this book Moreover none of the written material was self contained At present the subject has not reached its final form and active research is still being undertaken I present this subject of growing importance in a unified manner and by a fairly simple approach I present a route by which students can absorb and understand the subject only assuming that the reader is familiar with functional analysis especially bounded and unbounded operators on Hilbert spaces Moreover I assume a little basic knowledge of algebras Lie algebras Lie groups and manifolds at least the definitions The contents are presented in detail in the introduction in Chap The manuscript of this book has been successfully used by some advanced graduate students at Aarhus University Denmark in their A exam I thank them for comments Induced Representations of Infinite-dimensional Groups, I Alexander V. Kosyak, 2013 *Regular, Quasi-regular and Induced Representations of Infinite-dimensional Groups* Alexander V. Kosyak, 2018 The aim of the book is a systematic development by example of noncommutative harmonic analysis on infinite dimensional non locally compact matrix groups We generalize the notion of regular quasi regular and induced representations for arbitrary infinite dimensional groups The central idea to verify the irreducibility is the Ismagilov conjecture We also extend the Kirillov orbit method for the group of upper triangular matrices of infinite order publisher **Infinite Dimensional Groups and Their Representations** Karl-Hermann Neeb, 2000

Infinite-dimensional Representations of 2-groups, 2012 A 2 group is a category equipped with a multiplication satisfying laws like those of a group Just as groups have representations on vector spaces 2 groups have representations on 2 vector spaces which are categories analogous to vector spaces Unfortunately Lie 2 groups typically have few representations on the finite dimensional 2 vector spaces introduced by Kapranov and Voevodsky For this reason Crane Shepheard and Yetter introduced certain infinite dimensional 2 vector spaces called measurable categories since they are closely related to measurable fields of Hilbert spaces and used these to study infinite dimensional representations of certain Lie 2 groups Here

we continue this work We begin with a detailed study of measurable categories Then we give a geometrical description of the measurable representations intertwiners and 2 intertwiners for any skeletal measurable 2 group We study tensor products and direct sums for representations and various concepts of subrepresentation We describe direct sums of intertwiners and sub intertwiners features not seen in ordinary group representation theory We study irreducible and indecomposable representations and intertwiners We also study irretractable representations another feature not seen in ordinary group representation theory Finally we argue that measurable categories equipped with some extra structure deserve to be considered separable 2 Hilbert spaces and compare this idea to a tentative definition of 2 Hilbert spaces as representation categories of commutative von Neumann algebras

**Categories of Symmetries and Infinite-dimensional Groups** Yu. A. Neretin, 1996 For mathematicians working in group theory the study of the many infinite dimensional groups has been carried out in an individual and non coherent way For the first time these apparently disparate groups have been placed together in order to construct the big picture This book successfully gives an account of this and shows how such

seemingly dissimilar types such as the various groups of operators on Hilbert spaces or current groups are shown to belong to a bigger entity This is a ground breaking text will be important reading for advanced undergraduate and graduate mathematicians
