summarizes the efforts towards an open web based modular and extendable simulation platform for materials engineering
that allows simulations bridging several length scales In so doing it covers processes along the entire value chain and even
describes such different classes of materials as metallic alloys and polymers It comprehensively describes all structural ideas
the underlying concepts standard specifications the verification results obtained for different test cases and additionally how
to utilize the platform as a user and how to join it as a provider A resource for researchers users and simulation software
providers alike the monograph provides an overview of the current status serves as a generic manual for prospective users
and offers insights into the inner modular structure of the simulation platform **Advanced Materials & Processes**, 1998

Metals held at the Faculty of Engineering of the University of Porto Portugal 5 7 September 2018 This International
Colloquium facilitated and encouraged the exchange of knowledge and experiences among the different communities
involved in both basic and applied research in the field of the fatigue of metals looking at the problem of fatigue exploring
analytical and numerical simulative approaches Fatigue damage represents one of the most important types of damage to
which structural materials are subjected in normal industrial services that can finally result in a sudden and unexpected
abrupt fracture Since metal alloys are still today the most used materials in designing the majority of components and
structures able to carry the highest service loads the study of the different aspects of metals fatigue attracts permanent

attention of scientists engineers and designers
