**Processing of Heavy Crude Oils** Ramasamy Marappa Gounder, 2019 Unconventional heavy crude oils are replacing the conventional light crude oils slowly but steadily as a major energy source Heavy crude oils are cheaper and present an opportunity to the refiners to process them with higher profit margins However the unfavourable characteristics of heavy crude oils such as high viscosity low API gravity low H C ratio

chemical complexity with high asphaltenes content high acidity high sulfur and increased level of metal and heteroatom impurities impede extraction pumping transportation and processing Very poor mobility of the heavy oils due to very high viscosities significantly affects production and transportation Techniques for viscosity reduction drag reduction and in situ upgrading of the crude oil to improve the flow characteristics in pipelines are presented in this book The heavier and complex molecules of asphaltenes with low H C ratios present many technological challenges during the refining of the crude oil such as heavy coking on catalysts Hydrogen addition and carbon removal are the two approaches used to improve the recovery of value added products such as gasoline and diesel In addition the heavy crude oil needs pre treatment to remove the high levels of impurities before the crude oil can be refined This book introduces the major challenges and some of the methods to overcome them

**Phase Equilibrium Engineering** Esteban Alberto Brignole, Selva Pereda, 2013-04-02 Traditionally the teaching of phase equilibria emphasizes the relationships between the thermodynamic variables of each phase in equilibrium rather than its engineering applications This book changes the focus from the use of thermodynamics relationships to compute phase equilibria to the design and control of the phase conditions that a process needs Phase Equilibrium Engineering presents a systematic study and application of phase equilibrium tools to the development of chemical processes The thermodynamic modeling of mixtures for process development synthesis simulation design and optimization is analyzed The relation between the mixture molecular properties the selection of the thermodynamic model and the process technology that could be applied are discussed A classification of mixtures separation process thermodynamic models and technologies is presented to guide the engineer in the world of separation processes The phase condition required for a given reacting system is studied at subcritical and supercritical conditions The four cardinal points of phase equilibrium engineering are the chemical plant or process the laboratory the modeling of phase equilibria and the simulator The harmonization of all these components to obtain a better design or operation is the ultimate goal of phase equilibrium engineering Methodologies are discussed using relevant industrial examples The molecular nature and

composition of the process mixture is given a key role in process decisions Phase equilibrium diagrams are used as a drawing board for process implementation      **Petroleum Resources with Emphasis on Offshore Fields** Ove T.
