Software Quality and Productivity M. Lee, Ben-Zion Barta, Peter Juliff, 2013-04-17 As the world becomes increasingly dependent on the use of computers the need for quality software which can be produced at reasonable cost increases This IFIP proceedings brings together the work of leading researchers and practitioners who are concerned with the efficient production of quality software

Molecular and Metabolic Mechanisms Associated with Fleshy Fruit Quality Ana M. Fortes, Antonio Granell, Mario Pezzotti, Mondher Bouzayen, 2017-09-08 Fleshy Fruits are a late acquisition of plant evolution In addition of protecting the seeds these specialized organs unique to plants were developed to promote seed dispersal via the contribution of frugivorous animals Fruit development and ripening is a complex process and understanding the underlying genetic and molecular program is a very active field of research Part of the ripening process is directed to build up quality traits such as color texture and aroma that make the fruit attractive and palatable As fruit consumers humans have developed a time long interaction with fruits which contributed to make the fruit ripening attributes conform our needs and preferences This issue of Frontiers in Plant Science is intended to cover the most recent advances in our understanding of different aspects of fleshy fruit biology including the genetic molecular and metabolic mechanisms associated to each of the fruit quality traits It is also of prime importance to consider the effects of environmental cues cultural practices and postharvest methods and to decipher the mechanism by which they impact fruit quality traits Most of our knowledge of fleshy fruit development ripening and quality traits comes from work done in a reduced number of species that are not only of economic importance but can also benefit from a number of genetic and genomic tools available to their specific research communities For instance working with tomato and grape offers several advantages since the genome sequences of these two fleshy fruit species have been deciphered and a wide range of biological and genetic resources have been developed Ripening mutants are available for tomato which constitutes the main model system for fruit functional genomics In addition tomato is used as a reference species for climacteric fruit which ripening is controlled by the phytohormone ethylene Likewise grape is a reference species for non climacteric fruit even though no single master switches controlling ripening initiation have been uncovered yet In the last period the genome sequence of an increased number of fruit crop species became available which creates a suitable situation for research communities around crops to get organized and information to be shared through public repositories On the other hand the availability of genome wide expression profiling technologies has enabled an easier study of global transcriptional changes in fruit species where the sequenced genome is not yet available In this issue authors will present recent progress including original data as well as authoritative reviews on our understanding of fleshy fruit biology focusing on tomato and grape as model species

Silicon and Nano-silicon in Environmental Stress Management and Crop Quality Improvement Hassan Etesami, Abdullah H. Al Saeedi, Hassan El-Ramady, Masayuki Fujita, Mohammad Pessarakli, Mohammad Anwar Hossain, 2022-04-06 Silicon and Nano silicon in

Environmental Stress Management and Crop Quality Improvement Progress and Prospects provides a comprehensive overview of the latest understanding of the physiological biochemical and molecular basis of silicon and nano silicon mediated environmental stress tolerance and crop quality improvements in plants. The book not only covers silicon induced biotic and abiotic stress tolerance in crops but is also the first to include nano silicon mediated approaches to environmental stress tolerance in crops. As nanotechnology has emerged as a prominent tool for enhancing agricultural productivity and with the production and applications of nanoparticles (NPs) greatly increasing in many industries, this book is a welcomed resource. Enables the development of strategies to enhance crop productivity and better utilize natural resources to ensure future food security. Focuses on silicon and nano silicon mediated environmental stress tolerance. Addresses the challenges of both biotic and abiotic stresses.

Omics in Seed Development: Challenges and Opportunities for Improving of Seed Quality and Yield in Model and Crop Plants Daoquan Xiang, Zhaorong Hu, Raju Datla, 2025-03-06

Seed development represents an important phase of the life cycle in sexually reproducing plant species. A seed is a complex organ system of three components: the embryo that contributes to germline continuity, endosperm for nourishment, and the seed coat for protection. The developmental programs and the associated events that culminate in the production of a mature seed are highly complex and require precisely coordinated integration of the genetic, molecular, biochemical, metabolic, and physiological pathways and their interactions with environmental cues. Research advances in seed development using model and crop species such as *Arabidopsis*, rice, maize, wheat, and Brassica species have uncovered several key genes and pathways that regulate the cell and tissue specification, differentiation, and growth programs. The key findings from these studies are helping to develop a framework for advancing the knowledge and understanding of the process and the underpinning molecular mechanisms of an embryo, endosperm, and seed coat development. However, knowledge gaps still exist in understanding the regulating networks and metabolic programs involved in defining several important seed traits associated with seed quality and yield, especially in crop plants. Continued rapid advances in omics technologies have contributed to the development of several critical tools for performing genome, epigenome, transcriptome, proteome, and metabolome studies and their applications in seed development. Bioinformatics and computational tools are also playing important contributions in the large-scale genome-wide systems level analysis, modeling, and predictions to identify and characterize the underpinning mechanisms that support seed formation. A holistic understanding of the complexities and interactions that drive seed development is becoming increasingly possible with the application of omics tools to decipher gene, protein, and metabolite networks. In the proposed Research Topic, we highlight current advances in genomics, proteomics, lipidomics, metabolomics, metagenomics, transcriptomics, and phenomics studies of seed development in both model and crop species. We aim to further elucidate how these key genetic regulators and pathway genes act together to control cell division, patterning, differentiation, and storage reserve accumulation during seed development, how these critical processes coordinate to define the seed as a whole, and how the genetic and regulatory

networks function to generate tremendous natural diversity in the size number and compositional aspects of plant seeds

Recurrent/New Challenge for Plant Scientists in a Changing World Nadia Bertin, Michel Génard, Maarten Hertog, 2018-10-11 Besides increasing crop yield to feed the growing population improving crop quality is a challenging and

key issue Indeed quality determines consumer acceptability and increases the attractiveness of fresh and processed products In this respect fruit and vegetables which represent a main source of vitamins and other health compounds play a major role in human diet This is the case in developing countries where populations are prone to nutritional deficiencies but this is also a pending issue worldwide where the growing middle class is increasingly aware and in search of healthy food So a future challenge for the global horticultural industry will be to answer the demand for better quality food in a changing environment where many resources will be limited This e collection collates state of the art research on the quality of horticultural crops covering the underlying physiological processes the genetic and environmental controls during plant and organ development and the postharvest evolution of quality during storage and processing Genetic characterization of yield- and quality-related traits in legumes Qijiian Song, Jianghua Chen, Zhengjun Xia, Kyuya Harada, Chuanen Zhou, 2023-11-06

Innovative Production Strategies for High-Quality, Traditional Pig Products Giovanna Martelli, Eleonora Nannoni, 2021-09-10 In a number of European countries e.g. Spain Italy France Portugal Slovenia Croatia Poland a portion of the pig sector is aimed at the production of traditional and certified products e.g. PDO Protected Designation of Origin PGI Protected Geographical Indication Dry cured ham is probably the most famous traditional pork product however typical pork products are produced in and exported to many countries worldwide The meat used for producing these high quality delicacies needs to be suitable for seasoning and dry curing and these characteristics are the result of complex interactions between the animal breed genotype rearing condition feeding regime age and weight at slaughter etc and the environment without disregarding the importance of ethical attributes such as animal welfare and the environmental impact This Special Issue focuses on all the innovative production strategies for pigs intended for high quality typical productions in term of higher sustainability of the whole production chain improvement of animal welfare innovative feeding and farming techniques reduction in environmental impact improvement in meat and fat quality etc with emphasis on PDOs PGIs and other recognized production schemes and it is aimed at providing new insights for a wide range of stakeholders from

different countries Advanced Technologies for the Quality Control and Standardization of Plant Based Medicines Jiang Xu, Caroline Howard, 2020-06-18 Herbs and herbal products are of paramount importance for human health To be able to guarantee safety and quality standards and testing methods are needed Pharmacopoeias contain quality control protocols setting the standards which are then required by governments The quality traits are many including the intrinsic variables of medicinal plant e.g the levels of the active compounds and the absence of possibly naturally occurring toxic compounds On the other hand many quality traits are related to agricultural conditions and practices or to the harvesting and post harvest processing With so many variables quality control of the end product becomes extremely complex time consuming and costly To ensure the quality of medicinal plants for human consumption quality management the use of good practices at each step from seed to final product becomes a crucial aspect In general quality control includes the inspection of the product's identity purity and content based on its physical chemical or biological properties To ensure the quality of herbal medications criteria such as botanical quality type of preparation physical constants adulteration contaminants chemical constituents pesticides residues et al should be examined Meanwhile authentication of herbs is needed to avoid possible adulteration or contaminating plants even toxic herbs such as *Aristolochia* species Many of the methods are long standing such as microscopy in combination with color reactions but some 50 years ago chromatography developed as a major tool for both qualitative and quantitative analysis of herbal preparations Nowadays research is working on the improvement of these methods and on the development of novel tools For instance next generation sequencing and mass spectrometry imaging are emerging as new technologies for the quality control of herbal medicines With these technologies quick testing of herbal products and of mixed herbal powder preparations including the testing for specific plant parts botanical drugs can be achieved Also novel chemical tools such as metabolomics and Near Infrared Red NIR spectroscopy are being developed as powerful tools to identify and to link these with activity by using chemometric tools such as multivariate analysis Finally progress of informatic tools such as machine learning helps to deal with the big data generated by sequencing or mass spectrometry However these new technologies like all other new born technologies should be tested and perfected for a broad range of products

The Association between Avian Physiology and Meat Quality Yuwares Malila, Sandra G. Velleman, Casey M. Owens, Francesca Soglia, Marco Zampiga, 2024-02-08 The United Nations has recently released population projections suggesting that the global population will reach 9.7 billion by 2050 and exceed 11 billion by 2100 The increase in the world population may lead to food shortages especially that of food protein A variety of food protein alternatives have been developed and launched to the market to solve the problem of diminishing resources particularly of land and water In fact animal protein has become a target in recent times for its greenhouse gas emissions However the UN has projected a steady increase in demand for poultry meat over the upcoming decades The main demand will be from middle class and low income families in particular and is due mainly to its high production efficiency for inexpensive good quality proteins Nonetheless due to limited resources the poultry meat produced must be of high quality to ensure food security and minimize food waste
