Concepts and Measurement of Quality of Life in Health Care L.Y Nordenfelt, 1994-04-30 This volume brings together a number of scholarly studies on the definition assessment and measurement of human quality of life The book contains fundamental analyses of basic concepts such as welfare wellbeing happiness and quality of life itself but contains also discussions on the application of such concepts for measuring purposes mainly in a health care context Although the approach to these problems in the book is predominantly philosophical there are also some studies which take a different mainly sociological and medical point of view Most of the authors have a Scandinavian origin and their essays mirror the current debate on quality of life in northern Europe The book however also contains contributions by distinguished scholars from the U K France Italy and the Netherlands

Health-related quality of life after cardiac arrest Johan Israelsson, 2020-02-17 Background Cardiac arrest is a major health problem worldwide For many of the afflicted cardiac arrest is the natural end of life For others it is an unexpected event suddenly striking in the middle of life During the last decades major efforts in treatment have contributed to more people surviving their cardiac arrest However previous research has mainly focused on survival while the knowledge about health related quality of life in survivors is sparse Hence there is a need for more research in order to extend the knowledge about the living situations among survivors and their spouses For example factors associated with health related quality of life are not sufficiently investigated Knowledge about such factors is important in order to develop interventions and to be able to improve post cardiac arrest care In addition existing research shows incongruent results concerning differences in characteristics and survival between men and women In order to provide

equitable care between sexes further studies are warranted

Aim The overall aim of this thesis was to increase the knowledge of survival and health related quality of life among people suffering cardiac arrest with focus on sex and other related factors

The specific aims were to describe in hospital cardiac arrest events with regard to sex and investigate if sex is associated with survival after controlling for known predictors and interaction effects

study I to describe health status and psychological distress among in hospital cardiac arrest survivors in relation to sex

study II to investigate factors associated with health related quality of life among cardiac arrest survivors treated with an implantable cardioverter defibrillator in relation to sex and to compare their health related quality of life with a general population

study III and to investigate if type D personality and perceived control among cardiac arrest survivors and their spouses were associated with their own and their partners health related quality of life

study IV

Methods The general design in all studies I IV was quantitative cross sectional and correlational This thesis is based on four different data collections Data was systematically collected using national quality registries I and II or by sending questionnaires to survivors III and IV and their spouses IV treated at several different hospitals in Sweden The sample size varied between 126 and 990 across the studies The outcomes and explanatory study variables were chosen with respect to Wilson and Cleary s conceptual model of health related quality of life The main outcome variables were survival after resuscitation survival at hospital discharge survival at 30 days post cardiac arrest I and health related quality of life measured by the Hospital Anxiety and Depression Scale II and III and the EuroQol 5 dimensions II IV

In this thesis descriptive and inferential statistics were applied The main statistics consisted of logistic and linear regression analyses and structural equation modelling

Results Male sex was associated with a better chance of survival to hospital discharge but no associations between sex and survival after resuscitation or at 30 days were identified More men than women received resuscitation attempts when suffering an in hospital cardiac arrest

study I Health related quality of life among most cardiac arrest survivors was good II IV even when compared to a general population III However a significant proportion reported low health status and symptoms of anxiety and depression II and III Women reported worse health related quality of life compared to men and female sex was associated with poorer health related quality of life in the multiple regression models II and III

Several additional factors were identified to be associated with poorer health related quality of life being unemployed having a type D personality perceiving less control suffering from more comorbidities and suffering from more ICD related concerns III

In addition older age was associated with poorer EQ VAS or better HADS Anxiety health related quality of life depending of outcome measure II

Moreover perceived control and type D personality among the survivors were associated with health related quality of life among their spouses but not vice versa

Conclusions Although sex does not appear to be an important predictor for survival the difference between men and women regarding the proportion of resuscitation attempts should be further investigated The majority of survivors and their spouses report good health related quality of life similar to general populations However a substantial proportion suffer from health problems Since women in

general report worse health related quality of life compared to men a higher proportion of women may be in need of support Several factors associated with worse health related quality of life were identified and might be used during follow up and rehabilitation For example identifying type D personality might be important when screening patients at risk for health problems Perceiving more control could be targeted by health supportive interventions for example person centered care Healthcare professionals should make efforts to identify survivors at risk of poor health related quality of life and offer individualized support when needed Characteristics among survivors were associated with health related quality of life in their spouses Including spouses in follow up care is therefore important Wilson and Cleary s conceptual model for health related quality of life appears to be applicable for choosing outcomes in cardiac arrest research and might be helpful when designing interventions to improve post cardiac arrest care

Quality-of-Life Research in Chinese, Western and Global Contexts Daniel T.L. Shek,Ying Keung Chan,Paul S.N. Lee,2005-09-26 The majority of studies on the quality of life have been conducted in Western contexts and are based on Western participants Comparatively speaking there are only a few studies that have been conducted in different Chinese contexts Also there are fewer QOL studies based on children and adolescents or studies that examine the relationship between QOL and economic disadvantage In addition more research is needed to address the methodological issues related to the assessment of quality of life This volume is a constructive response to the challenges described above It is the first book to cover research in Chinese Western and global contexts in a single volume It is a ground breaking volume in which Chinese studies on the quality of life are collected The book includes papers addressing family QOL quality of life in adolescents experiencing economic disadvantage and methodological issues in the assessment of QOL It is written by researchers working in a variety of disciplines
