expected ones meet A schematic is presented which classifies different entities which contribute to the quality of a service taking into account conversational user as well as service related contributions Starting from this concept perceptively relevant constituents of speech communication quality are identified The perceptive factors result from elements of the transmission configuration A simulation model is developed and implemented which allows the most relevant parameters of traditional transmission configurations to be manipulated in real time and for the conversation situation Inputs into the simulation are instrumentally measurable quality elements commonly used in transmission planning of telephone networks A reduced set of these quality elements forms a basis for models which aim at predicting mouth to ear quality as it would be perceived by a user of the system These models are an important tool for the planner of telecommunication networks as they allow the expected quality to be estimated in advance even before the network has been set up Two well known models the SUBMOD and the E model are analyzed in more detail with an emphasis on the psychoacoustic and psychophysical backgrounds
