Quantitative Approaches to Metabolism D. G. Cramp, **Mathematical Modeling in Experimental Nutrition** Andrew J. Clifford, Hans-Georg Müller, 2013-11-21 Nutrients have been recognized as essential for maximum growth successful reproduction and infection prevention since the 1940s since that time the lion s share of nutrient research has focused on defining their role in these processes Around 1990 however a major shift began in the way that researchers viewed some nutrients particularly the vitamins This shift was motivated by the discovery that modest declines in vitamin nutritional status are associated with an increased risk of ill health and disease such as neural tube defects heart disease and cancer especially in those populations or individuals who are genetically predisposed In an effort to expand upon this new understanding of nutrient action nutritionists are increasingly turning their focus to the mathematical modeling of nutrient kinetic data The availability of suitably tagged isotope nutrients such as B carotene vitamin A folate among others sensitive analytical methods to trace them in humans mass spectrometry and accelerator mass spectrometry and powerful software capable of solving and manipulating differential equations efficiently and accurately has allowed researchers to construct mathematical models aimed at characterizing the dynamic and kinetic behavior of key nutrients in vivo in humans at an unparalleled level of detail Objective Medical Decision-Making Systems Approach in Disease Dimitris D. M. Arnez, C. A. Brebbia, F. Solina, V. Stankovski, 2003-03-11 Computer models have become increasingly successful in simulating biological phenomena The advantages of this approach are numerous particularly in biomedicine where it has led to a better understanding of the mechanics of physiological processes The use of computational models has also spread to many applications in medicine as demonstrated by the contents of this volume Containing papers presented at the Fifth International Conference on Computer Simulations in Biomedicine the book covers a broad spectrum of topics on applications in this area The contributions featured are arranged in sections according to their medical and biological perspective in order to make the contents more accessible to medical professionals Over 50 papers are included and these are divided under the general headings Simulation of Physiological Processes Cardiovascular System Vascular System Lung Cardiac Applications Artificial Limbs Electrical Stimulation Functional Electrical Stimulation Cellular Engineering Data Acquisition Applications of Artificial Intelligence in Medicine and Virtual Intelligent Environments Research Awards Index , 1989 **The Sustainable City XV** S. Consisting of presented papers from the 15th International Conference on Urban Regeneration and Sustainability the included works address various aspects of the urban environment and provide solutions leading towards sustainability Urban areas result in a series of environmental challenges varying from the consumption of natural resources and the subsequent generation of waste and pollution contributing to the development of social and economic imbalances As cities continue to grow all over the world these problems tend to become more acute and require the development of new solutions The challenge of planning sustainable contemporary cities lies in considering the dynamics of urban systems exchange of energy and matter and the function and maintenance of ordered structures directly or indirectly supplied and maintained by natural systems The task of researchers is to improve the capacity to manage human activities pursuing welfare and prosperity in the urban environment Any investigation or planning on a city ought to consider the relationships between the parts and their connections with the living world The dynamics of its networks flows of energy matter people goods information and other resources are fundamental for an understanding of the evolving nature of today s cities Large cities represent a fertile ground for architects engineers city planners social and political scientists and other professionals able to conceive new ideas and time them according to technological advances and human requirements Coastal areas and coastal cities are an important area covered in this volume as they have some specific features Their strategic location facilitates transportation and the development of related activities but this requires the existence of large ports with the corresponding increase in maritime and road traffic and all its inherent negative effects This requires the development of well planned and managed urban environments not only for reasons of efficiency and economics but also to avoid inflicting environmental degradation that causes the deterioration of natural resources quality of life and human health These research papers put a focus on sustainability across the multidisciplinary components of urban planning the challenges presented by the increasing size of cities the number of resources required and the complexity of modern society
