**Abstract** The time dependent quantum transport theory has attracted a great deal of interest in the past decade However some concepts in the frequency dependent transport theory remain confused Based on the Keldysh non equilibrium green's function formalism for time dependent quantum transport new expressions for dynamic current and admittance are derived in this thesis which satisfy gauge invariance and current continuity The key concepts in this field are clarified The derivation is under wideband limit WBL and first order approximations This new formalism is validated by first principle time dependent calculations of three carbon based nano devices Later a study on asymmetric systems is carried out by this new theory and discussion on current conservation problem is presented This new ac quantum transport theory can cooperate with electromagnetic method to solve a mesoscopic problem The active core part which is usually under atomistic scale is simulated by frequency domain quantum transport theory while the broad environment is tackled with electromagnetic solver By a careful treatment at the interface between two solvers this quantum mechanic electromagnetic QM EM method is implemented self consistently This QM EM method is also validated by calculations of the transient current through a carbon nanotube based device surrounded by silicon environment under a small ac bias voltage The small signal and WBL approximations are also adopted in the development of this method As a supplementary to the family of QM

EM methods static and time dependent QM EM method are already established this method shows very good efficient and high accuracy Beyond linear response in frequency domain we have also studied some nonlinear effects As one application of nonlinear effect memristor has attracted great attention in the past few years Through Fourier analysis method we have now understood the physical and mathematical mechanisms of ideal memristor memcapacitor and meminductor We have proposed methods to verify ideal memristor memcapacitor and meminductor and to find out their intrinsic parameters which can be employed to predict their behavior under various input signals This study may also provide an instruction on experimental research DOI 10.5353/th.b5387998 Subjects Quantum theory Transport theory
