Diophantine Approximation on Linear Algebraic Groups Michel Waldschmidt, 2013-03-14 The theory of transcendental numbers is closely related to the study of diophantine approximation This book deals with values of the usual exponential function e z a central open problem is the conjecture on algebraic independence of logarithms of algebraic numbers Two chapters provide complete and simplified proofs of zero estimates due to Philippon on linear algebraic groups **French Mathematical Seminars** Nancy D. Anderson, 1989 Intended for mathematics librarians the list allows librarians to ascertain if a seminaire has been published which library has it and the forms of entry under which it has been cataloged

C0-Groups, Commutator Methods and Spectral Theory of N-Body Hamiltonians Werner Amrein, Anne Boutet de Monvel, Vladimir Georgescu, 2013-03-09 The relevance of commutator methods in spectral and scattering theory has been known for a long time and numerous interesting results have been ob tained by such methods The reader may find a description and references in the books by Putnam Pu Reed Simon RS and Baumgartel Wollenberg BW for example A new point of view emerged around 1979 with the work of E Mourre in which the method of locally conjugate operators was introduced His idea proved to be remarkably fruitful in establishing detailed spectral properties of N body Hamiltonians A problem that was considered extremely difficult be fore that time the proof of the absence of a singularly continuous

spectrum for such operators was then solved in a rather straightforward manner by E Mourre himself for $N=3$ and by P Perry, I Sigal and B Simon for general N . The Mourre estimate which is the main input of the method also has consequences concerning the behaviour of N body systems at large times. A deeper study of such propagation properties allowed I Sigal and A Soffer in 1985 to prove existence and completeness of wave operators for N body systems with short range interactions without implicit conditions on the potentials. For $N=3$ similar results were obtained before by means of purely time dependent methods by V Enss and by K Sinha, M Krishna and P Muthuramalingam. Our interest in commutator methods was raised by the major achievements mentioned above.

Mathematical Software - ICMS 2020 Anna Maria Bigatti, Jacques Carette, James H. Davenport, Michael Joswig, Timo de Wolff, 2020-07-07. This book constitutes the proceedings of the 7th International Conference on Mathematical Software ICMS 2020 held in Braunschweig Germany in July 2020. The 48 papers included in this volume were carefully reviewed and selected from 58 submissions. The program of the 2020 meeting consisted of 20 topical sessions each of which providing an overview of the challenges, achievements and progress in a environment of mathematical software research development and use.

Symplectic Geometry B. Aebischer, M. Borer, M. Kälin, C. Leuenberger, Hans Martin Bach, 2013-06-29. The seminar Symplectic Geometry at the University of Berne in summer 1992 showed that the topic of this book is a very active field where many different branches of mathematics come together: differential geometry, topology, partial differential equations, variational calculus and complex analysis. As usual in such a situation it may be tedious to collect all the necessary ingredients. The present book is intended to give the nonspecialist a solid introduction to the recent developments in symplectic and contact geometry. Chapter 1 gives a review of the symplectic group $Sp(n, \mathbb{R})$, symplectic manifolds and Hamiltonian systems; last but not least to fix the notations. The Maslov index for closed curves as well as arcs in $Sp(n, \mathbb{R})$ is discussed. This index will be used in chapters 5 and 8. Chapter 2 contains a more detailed account of symplectic manifolds starting with a proof of the Darboux theorem saying that there are no local invariants in symplectic geometry. The most important examples of symplectic manifolds will be introduced: cotangent spaces and Kähler manifolds. Finally we discuss the theory of coadjoint orbits and the Kostant-Souriau theorem which are concerned with the question of which homogeneous spaces carry a symplectic structure.

Automatic Sequences Jean-Paul Allouche, Jeffrey Shallit, 2003-07-21. Uniting dozens of seemingly disparate results from different fields, this book combines concepts from mathematics and computer science to present the first integrated treatment of sequences generated by finite automata. The authors apply the theory to the study of automatic sequences and their generalizations such as Sturmian words and k -regular sequences. And further they provide applications to number theory particularly to formal power series and transcendence in finite characteristic, physics, computer graphics and music. Starting from first principles wherever feasible, basic results from combinatorics on words, numeration systems and models of computation are discussed. Thus this book is suitable for graduate students or advanced

undergraduates as well as for mature researchers wishing to know more about this fascinating subject Results are presented from first principles wherever feasible and the book is supplemented by a collection of 460 exercises 85 open problems and over 1600 citations to the literature

Arithmetic Functions and Integer Products P.D.T.A. Elliott, 2012-12-06 Every positive integer m has a product representation of the form $m = \prod_{k=1}^{\infty} p_k^{n_k}$ where p_k are prime numbers and the n_k are positive integers and each E_i is a value can be given for v which is uniform in the m A representation can be computed so that no n_i exceeds a certain fixed power of $2m$ and the number k of terms needed does not exceed a fixed power of $\log 2m$ Consider next the collection of finite probability spaces whose associated measures assume only rational values Let $h(x)$ be a real valued function which measures the information in an event depending only upon the probability x with which that event occurs Assuming $h(x)$ to be non negative and to satisfy certain standard properties it must have the form $h(x) = -\log x$ Except for a renormalization this is the well known function of Shannon What do these results have in common They both apply the theory of arithmetic functions The two widest classes of arithmetic functions are the real valued additive and the complex valued multiplicative functions Beginning in the thirties of this century the work of Erdős Kac Kubilius Turán and others gave a discipline to the study of the general value distribution of arithmetic functions by the introduction of ideas methods and results from the theory of Probability I gave an account of the resulting extensive and still developing branch of Number Theory in volumes 239 240 of this series under the title Probabilistic Number Theory

Combinatorics, Automata and Number Theory Valérie Berthé, Michel Rigo, 2010-08-12 This collaborative volume presents recent trends arising from the fruitful interaction between the themes of combinatorics on words automata and formal language theory and number theory Presenting several important tools and concepts the authors also reveal some of the exciting and important relationships that exist between these different fields Topics include numeration systems word complexity function morphic words Rauzy tilings and substitutive dynamical systems Bratelli diagrams frequencies and ergodicity Diophantine approximation and transcendence asymptotic properties of digital functions decidability issues for DOL systems matrix products and joint spectral radius Topics are presented in a way that links them to the three main themes but also extends them to dynamical systems and ergodic theory fractals tilings and spectral properties of matrices Graduate students research mathematicians and computer scientists working in combinatorics theory of computation number theory symbolic dynamics fractals tilings and stringology will find much of interest in this book

Elliptic Curves Dale Husemoller, 2013-06-29 The book divides naturally into several parts according to the level of the material the background required of the reader and the style of presentation with respect to details of proofs For example the first part to Chapter 6 is undergraduate in level the second part requires a background in Galois theory and the third some complex analysis while the last parts from Chapter 12 on are mostly at graduate level A general outline of much of the material can be found in Tate's colloquium lectures reproduced as an article in *Inventiones* 1974 The first part grew out of Tate's 1961 Haverford Philips Lectures as an attempt to write something for publication closely related

to the original Tate notes which were more or less taken from the tape recording of the lectures themselves This includes parts of the Introduction and the first six chapters The aim of this part is to prove by elementary methods the Mordell theorem on the finite generation of the rational points on elliptic curves defined over the rational numbers In 1970 Tate returned to Haverford to give again in revised form the original lectures of 1961 and to extend the material so that it would be suitable for publication This led to a broader plan for the book Substitutions in Dynamics, Arithmetics and Combinatorics

N. Pytheas Fogg, 2003-10-24 A certain category of infinite strings of letters on a finite alphabet is presented here chosen among the simplest possible one may build both because they are very deterministic and because they are built by simple rules a letter is replaced by a word a sequence is produced by iteration These substitutive sequences have a surprisingly rich structure The authors describe the concepts of quantity of natural interactions with combinatorics on words ergodic theory linear algebra spectral theory geometry of tilings theoretical computer science diophantine approximation transcendence graph theory This volume fulfils the need for a reference on the basic definitions and theorems as well as for a state of the art survey of the more difficult and unsolved problems
