The Descent of Man Charles Darwin, 1874 *The Origin of Species by means of Natural Selection* Charles Darwin, 2021-08-10 *The Origin of Species by means of Natural Selection* Charles Darwin The *Origin* is one of the most important books ever published and a knowledge of it should be a part of the intellectual equipment of every educated person The book will endure in future ages so long as a knowledge of science persists among mankind Nature It took Charles Darwin more than twenty years to publish this book in part because he realized that it would ignite a firestorm of controversy On the *Origin of Species* first appeared in 1859 and it remains a continuing source of conflict to this day Even among those who reject its ideas however the work's impact is undeniable In science philosophy and theology this is a book that changed the world In addition to its status as the focus of a dramatic turning point in scientific thought On the *Origin of Species* stands as a remarkably readable study Carefully reasoned and well documented in its arguments the work offers coherent views of natural selection adaptation the struggle for existence survival of the fittest and other concepts that form the foundation of modern evolutionary theory This volume is a reprint of the critically acclaimed first edition *The Origin of Species* Charles

Darwin,1981 In the current resurgence of interest in the biological basis of animal behavior and social organization the ideas and questions pursued by Charles Darwin remain fresh and insightful This is especially true of The Descent of Man and Selection in Relation to Sex Darwin s second most important work This edition is a facsimile reprint of the first printing of the first edition 1871 not previously available in paperback The work is divided into two parts Part One marshals behavioral and morphological evidence to argue that humans evolved from other animals Darwin shoes that human mental and emotional capacities far from making human beings unique are evidence of an animal origin and evolutionary development Part Two is an extended discussion of the differences between the sexes of many species and how they arose as a result of selection Here Darwin lays the foundation for much contemporary research by arguing that many characteristics of animals have evolved not in response to the selective pressures exerted by their physical and biological environment but rather to confer an advantage in sexual competition These two themes are drawn together in two final chapters on the role of sexual selection in humans In their Introduction Professors Bonner and May discuss the place of The Descent in its own time and relation to current work in biology and other disciplines The Descent of Man, and Selection in Relation to Sex Charles Darwin,1872

scientific theory that this branching pattern of evolution resulted from a process that he called natural selection in which the struggle for existence has a similar effect to the artificial selection involved in selective breeding

The Descent of Man, and Selection in Relation to Sex Charles Darwin, 2004-06 In the discussion on Sexual Selection in my Descent of Man no case interested and perplexed me so much as the brightly coloured hinder ends and adjoining parts of certain monkeys As these parts are more brightly coloured in one sex than the other and as they become more brilliant during the season of love I concluded that the colours had been gained as a sexual attraction

The Descent of Man and Selection in Relation to Sex Charles Darwin, 1871-02-24

The nature of the following work will be best understood by a brief account of how it came to be written. During many years I collected notes on the origin or descent of man without any intention of publishing on the subject but rather with the determination not to publish as I thought that I should thus only add to the prejudices against my views. It seemed to me sufficient to indicate in the first edition of my *Origin of Species* that by this work light would be thrown on the origin of man and his history and this implies that man must be included with other organic beings in any general conclusion respecting his manner of appearance on this earth. Now the case wears a wholly different aspect. When a naturalist like Carl Vogt ventures to say in his address as President of the National Institution of Geneva 1869: "personne en Europe au moins n'ose plus soutenir la création indépendante et de toutes pièces des espèces" it is manifest that at least a large number of naturalists must admit that species are the modified descendants of other species and this especially holds good with the younger and rising naturalists.

On the Origin of Species Charles Darwin, Murat Ukray, 2014-09-14

On the Origin of Species published on 24 November 1859 is a work of scientific literature by Charles Darwin which is considered to be the foundation of evolutionary biology. Its full title was *On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life*. For the sixth edition of 1872 the short title was changed to *The Origin of Species*. Darwin's book introduced the scientific theory that populations evolve over the course of generations through a process of natural selection. It presented a body of evidence that the diversity of life arose by common descent through a branching pattern of evolution. Darwin included evidence that he had gathered on the Beagle expedition in the 1830s and his subsequent findings from research, correspondence, and experimentation. Various evolutionary ideas had already been proposed to explain new findings in biology. There was growing support for such ideas among dissident anatomists and the general public but during the first half of the 19th century the English scientific establishment was closely tied to the Church of England while science was part of natural theology. Ideas about the transmutation of species were controversial as they conflicted with the beliefs that species were unchanging parts of a designed hierarchy and that humans were unique, unrelated to other animals. The political and theological implications were intensely debated but transmutation was not accepted by the scientific mainstream. The book was written for non-specialist readers and attracted widespread interest upon its publication. As Darwin was an eminent scientist, his findings were taken seriously and the evidence he presented generated scientific, philosophical, and religious discussion. The debate over the book contributed to the campaign by T. H. Huxley and his fellow members of the X Club to secularise science by promoting scientific naturalism. Within two decades there was widespread scientific agreement that evolution with a branching pattern of common descent had occurred but scientists were slow to give natural selection the significance that Darwin thought appropriate. During the eclipse of Darwinism from the 1880s to the 1930s various other

mechanisms of evolution were given more credit With the development of the modern evolutionary synthesis in the 1930s and 1940s Darwin s concept of evolutionary adaptation through natural selection became central to modern evolutionary theory and it has now become the unifying concept of the life sciences Summary of Darwin s theory Darwin s theory of evolution is based on key facts and the inferences drawn from them which biologist Ernst Mayr summarised as follows Every species is fertile enough that if all offspring survived to reproduce the population would grow fact Despite periodic fluctuations populations remain roughly the same size fact Resources such as food are limited and are relatively stable over time fact A struggle for survival ensues inference Individuals in a population vary significantly from one another fact Much of this variation is inheritable fact Individuals less suited to the environment are less likely to survive and less likely to reproduce individuals more suited to the environment are more likely to survive and more likely to reproduce and leave their inheritable traits to future generations which produces the process of natural selection inference This slowly effected process results in populations changing to adapt to their environments and ultimately these variations accumulate over time to form new species inference

The Descent of Man Charles Darwin,Dragan Nikolic,2014-11-16 Darwin wrote of the fiery ordeal through which this book has passed He had avoided the logical outcome of the general theory of evolution bringing man into the scheme for twelve years and in fact it had by that time been so much accepted that the clamor of the opposition was not strident He had also been preceded in 1863 by Huxley s *Man s place in nature* In this book word evolution occurs for the first time in any of Darwin s works The last chapter is about sexual selection in relation to man and it ends with the famous peroration about man s lowly origin the wording of which differs slightly in the first edition from that which is usually quoted In a letter dated March 28 1871 Emma Darwin Vol II pp 202 203 Darwin mentions the help that his daughter Henrietta Emma had given him in reading the manuscript and correcting the style and calls her my very dear coadjutor and fellow labourer

Darwin's *Origin of Species* (publ. 1859) is a pivotal work in scientific literature and arguably the pivotal work in evolutionary biology. The book's full title is *On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life*. It introduced the theory that populations evolve over the course of generations through a process of natural selection. It was controversial because it contradicted religious beliefs which underlay the then current theories of biology. Darwin's book was the culmination of evidence he had accumulated on the voyage of the *Beagle* in the 1830s and added to through continuing investigations and experiments since his return. *On the Origin of Species, 6th Edition* Charles Darwin, 2016-12-11. Charles Darwin's *On the Origin of Species*, in which he writes of his theories of evolution by natural selection, is one of the most important works of scientific study ever published.
