Orthostatic Disorders Of The Circulation Mechanisms Manifestations And Treatment:

Orthostatic Disorders of the Circulation David H.P. Streeten, 2012-12-06 Most of us spend at least two thirds of our lives either sitting or standing It is somewhat surprising therefore to find not a single book devoted to disorders caused by derangements of the normal physiological adjustments to changes in posture In fact until very recently medical students have not even been advised to measure the blood pressure and heart rate in the upright posture as part of the routine physical examination Although Bradbury and Eggleston first described orthostatic hypotension as a consequence of autonomic insufficiency in 1925 interest in orthostatic disorders has been slow to develop in the subsequent years It is well known that the change from recumbency to the standing posture stimulates neurological endocrine and cardiovascular adjustments that ensure maintenance of a normal circulation despite the effects of gravitational forces The mechanisms of these physiological responses to orthostasis have been studied by many investigators Some of the defects to which antigravitational compensatory mechanisms are subject such as postural hypotension resulting from autonomic failure have been studied intensively and have become part of the general knowledge of most medical practitioners Other orthostatic disorders such as various other postural abnormalities of blood pressure control and orthostatic edema have received far less attention and have been unable to compete with the more dramatic and life threatening ailments of humankind for a place in our standard medical texts These disorders often give rise to distressing symptoms and may lead to severe impairment of health

Reversibility of Chronic Degenerative Disease and Hypersensitivity, Volume 1 William J. Rea, Kalpana Patel, 2010-06-18 The clinical approaches to the chronic degenerative diseases that drain our resources and compromise our well being have become almost exclusively symptom focused The common wisdom is that they are idiopathic with final outcomes to be managed rather than prevented or cured That they are potentially reversible rarely enters into any discussion

Neuropsychology of Cardiovascular Disease Shari R. Waldstein, Merrill F.

Elias, 2015-02-11 Cardiovascular disease CVD is the leading cause of morbidity and mortality in the United States and most westernized nations Both CVDs and their risk factors confer substantial risk for stroke and dementia but are also associated with more subtle changes in brain structure and function and cognitive performance prior to such devastating clinical outcomes It has been suggested that there exists a continuum of brain abnormalities and cognitive difficulties associated with increasingly severe manifestations of cardiovascular risk factors and diseases that precede vascular cognitive impairment and may ultimately culminate in stroke or dementia This second edition examines the relations of a host of behavioral and biomedical risk factors in addition to subclinical and clinical CVDs to brain and cognitive function Associations with dementia and pre dementia cognitive performance are reported described and discussed with a focus on underlying brain mechanisms Future research agendas are suggested and clinical implications are considered The volume is a resource for professionals and students in neuropsychology behavioral medicine neurology cardiology cardiovascular and behavioral epidemiology gerontology geriatric medicine nursing adult developmental psychology and for other physicians and health care professionals who work with patients with or at risk for CVDs

Angiology in Practice A-M. Salmasi, A. Strano, 2012-12-06 Arterial and venous diseases are major causes of morbidity and mortality in most of the world especially in the western hemisphere Not only of interest to angiologists these illnesses are also of concern to most physicians in various fields ranging from cardiology general medicine and cardiovascular surgery to physiology pathology and clinical pharmacology Specialists in diabetes hypertension and epidemiology find these illnesses as challenging in their own fields of interest due to the gross interrelation of these diseases with their specialties This book of 35 chapters contains an up to date discussion of various arterial and venous illnesses presenting major clinical applications ranging from basic pathology haemodynamics and haemorheology to clinical features and management Special attention has also been paid to epidemiology and prevention discussing all the issues concerned A special section on vascular emergency has also been included thereby extending its usefulness to physicians and surgeons working in accident and emergency units

Charcot's Bad Idea Simon Overton, 2009-06-07 This book charts the ways in which the ideas of a 19th Century neurologist became enshrined in the thinking of modern neuropsychiatry It looks at how the diagnosis of hysteria and conversion disorder was revitalised by a group of like minded physicians under the terms of functional weakness and functional neurological deficit in order to develop constructive ways of talking with patients Overton claims this approach has fundamentally failed and the often hilarious jibes he makes at some sectors of the medical profession only highlight further the need for doctors to listen to their patients Deserves to be part of the literary canon

Research Awards Index, 1989 Clinical Science, 2007 Orthostatic Hypotension in Older Adults Ahmet Turan Isik, Pinar Soysal, 2020-12-21. This book provides a comprehensive and practical guide to orthostatic hypotension (OH) for doctors and nurses involved in the care of older adults, together with a state-of-the-art update on OH covering its epidemiology, pathophysiology, assessment, diagnosis, causes, prevention, management, and relevance for geriatric practice. In addition, it addresses mechanisms of orthostatic tolerance and other orthostasis-related conditions, as well as drugs, comorbidities, and geriatric syndromes related to OH. The homeostatic ability to maintain blood pressure while standing requires an adequate blood volume and the integrity of the nervous system, heart, blood vessels, and muscle pump. However, in older adults, some age-related factors can contribute to the development of OH. For example, decreased baroreflex sensitivity, 1) adrenergic vasoconstrictor response to sympathetic stimuli, parasympathetic activity, renal salt and water conservation, increased vascular stiffness, and decreased ventricular diastolic filling, as well as concentrated capacities of the kidney, may be associated with changes in postural blood pressure. It has also been shown that OH is associated with falls, cardiac events, heart failure, stroke, reduced quality of life, and increased risk of overall mortality in these patients. Orthostatic Hypotension in Older Adults will be of considerable interest to all professionals working in the fields of geriatrics, geriatric psychiatry, neurology, internal medicine, cardiology, and emergency medicine, or working with older people in hospitals or in their
