Landscape Ecology in Theory and Practice Monica G. Turner, Robert H. Gardner, Robert V. O'Neill, 2007-05-08 An ideal text for students taking a course in landscape ecology The book has been written by very well known practitioners and pioneers in the new field of ecological analysis Landscape ecology has emerged during the past two decades as a new and exciting level of ecological study Environmental problems such as global climate change land use change habitat fragmentation and loss of biodiversity have required ecologists to expand their traditional spatial and temporal scales and the widespread availability of remote imagery geographic information systems and desk top computing has permitted the development of spatially explicit analyses In this new text book this new field of landscape ecology is given the first fully integrated treatment suitable for the student Throughout the theoretical developments modeling approaches and results and empirical data are merged together so as not to introduce barriers to the synthesis of the various approaches that constitute an effective ecological synthesis The book also emphasizes selected topic areas in which landscape ecology has made the most contributions to our understanding of ecological processes as well as identifying areas where its contributions have been limited Each chapter features questions for discussion as well as recommended reading

Experimental Landscape Ecology Yolanda F. Wiersma, 2022-04-07 This book offers the first guide to landscape ecologists on the art and science of doing experiments both observational and manipulative How do you conduct an experiment when your study subject is as big as a landscape Issues of scale spatial heterogeneity and limitations on replication may challenge scientists seeking to carry out robust experiments in landscape

ecology Beginning with an overview of the history and philosophy of the scientific method and tracing the development of experimental approaches in ecology broadly the first half of the book discusses the broader issues of what makes a good experiment Individual chapters describe unique aspects of landscape ecology that present challenges to experimentation with suggestions for solutions on issues of scale and how to apply controls randomization and adequate replication in a landscape setting The second half of the book describes different kinds of landscape ecology experimental approaches including large scale manipulations experimental model landscapes mesocosms and microcosms in silico experiments novel landscapes Each chapter describes the advantages and disadvantages of each approach and identifies the types of landscape ecology concepts and questions that a research can address Examples from around the world in a myriad of different environments help to illustrate the ideas in each chapter Together with an annotated resources section this book aims to stimulate ideas and inspire creativity for graduate students and early career researchers who want to conduct better experiments in landscape ecology

Statistics for the 21st Century Gabor Szekely, 2000-01-25 A selection of articles presented at the Eighth Lukacs Symposium held at the Bowling Green State University Ohio They discuss consistency and accuracy of the sequential bootstrap hypothesis testing geometry in multivariate analysis the classical extreme value model the analysis of cross classified data diffusion models for neural activity e

Freshwater Ecology Gerry Closs, Barbara Downes, Andrew Boulton, 2009-04-01 Freshwater ecosystems are under increasing pressure as human populations grow and the need for clean water intensifies The demand for ecologists and environmental managers who are trained in basic freshwater ecology has never been greater Students and practitioners new to the field of freshwater ecology and management need a text that provides them with an accessible introduction to the key questions while still providing sufficient background on basic scientific methods Gerry Closs Barbara Downes and Andrew Boulton have written a text that meets the requirements of these students Following an introduction to scientific methodology and its application to the study of ecology several key concepts in freshwater ecology are reviewed using a wide range of scientific studies into fundamental and applied ecological questions Key ecological questions that are explored in a freshwater context include the role of animal dispersal and predators on freshwater community structure and the impact of pollutants and introduced species on freshwater ecosystems This book represents the only freshwater ecology textbook that is specifically aimed at an introductory level It will also be a useful primer for students who have not previously taken a specialized freshwater course but who require an accessible overview of the subject General reviews on the methods of science influence of scale and the main features of freshwater systems Coverage of several fundamental and applied ecological questions A logical structure in each chapter that builds from a general observation of an ecological pattern to an exploration of the various scientific approaches that can be used to investigate such patterns Suggested further reading lists for each chapter

Toward Gleasonian Landscape Ecology, 2010 The fusion of individualistic community ecology with the Hutchinsonian niche concept

enabled a broad integration of ecological theory spanning all the way from the niche characteristics of individual species to the composition structure and dynamics of ecological communities Landscape ecology has been variously described as the study of the structure function and management of large heterogeneous land areas Any reading of the published landscape ecology literature shows near uniformity in the adoption of a categorical patch mosaic paradigm However if biological communities are multivariate gradients of species composition with each species responding individually to particular combinations of limiting factors is a categorical patch based representation appropriate We evaluate the sufficiency of several patch based representations of vegetation at the landscape level to explain the composition of the plant community Classified vegetation maps all performed poorly in explaining the composition and structure of forest trees among plots Different categorical vegetation maps provided largely independent explanations of species variability Individual species models based on spectral topographic and climatic variables vastly out performed those produced using the classified maps By moving from a landscape ecological paradigm based on categorical patches to one based on quantitative species and environmental responses across continuous space it will be possible to both produce much more effective predictions of species distributions and ecological processes and remove much of the disjunction between landscape ecology and mainstream community ecology theory Plant Disease Epidemiology: Facing Challenges of the 21st Century S.

Savary,B.M. Cooke,2007-12-13 Plant disease epidemiologists have a strong scientific tradition in studying climate pathogen disease relationships Biodiversity is also of global concern The decline of global biodiversity that is currently taking place has been referred to as the sixth great extinction process our planet has experienced during its history but this time it is man made Generations of plant pathologists and especially of plant disease epidemiologists have been dealing with biodiversity It is from this diversity that presumably the most potent instrument for disease management has been developed by plant pathologists host plant resistance Host plant diversity and the disease resistance genes it harbours can be deployed over time and space according to epidemiological principles Sustainable production and protection systems also need to be devised which could exploit scarcer resources sparingly and if possible enhance the resource base Plant disease epidemiologists alone cannot provide answers to such questions but certainly could significantly contribute to these new strategies This book provides an overview of some of the latest research in plant disease epidemiology from researchers at the cutting edge of this important discipline Spatial Modeling of Forest Landscape Change David J. Mladenoff,William L.

Baker,1999-08-26 Key researchers present newly emerging approaches to computer simulation models of large forest landscapes **Advances in Urban Ecology** marina Alberti,2007-12-20 This groundbreaking work is an attempt at providing a conceptual framework to synthesize urban and ecological dynamics into a common framework The greatest challenge for urban ecologists in the next few decades is to understand the role humans play in urban ecosystems The development of an integrated urban ecological approach is crucial to advance ecological research and to help planners and

managers solve complex urban environmental issues This book is a major step forward **Aquatic Insects** Royal Entomological Society of London. Symposium,2008 Considers the challenges facing insect populations in aquatic environments and how they have adapted to achieve such prominence in virtually all habitats SUMMARY

Biocontrol-Based Integrated Management of Oilseed Rape Pests Ingrid H. Williams,2010-06-16 Oilseed rape is a major arable crop in both Europe and North America It is attacked by unique complexes of insect pests still largely controlled through the application of chemical insecticides Crop management systems for the future must combine sustainability with environmental acceptability to satisfy both social and economic demands This book in its 17 chapters each led by a world expert reviews research progress towards developing integrated pest management systems for the crop that enhance conservation biocontrol This approach is particularly timely because of the development in Europe of insecticide resistance in the pollen beetle a major pest of the crop The past decade has seen considerable progress in our knowledge of the parasitoids and predators that contribute to biocontrol of their distribution patterns and their behavioural ecology both within and without the crop There is potential for natural enemy conservation through modification of within field crop husbandry practices as well as on the landscape scale through habitat manipulation to encourage vegetational diversity This book will prove invaluable as a text for researchers university teachers graduate scientists extension workers and growers involved in integrated pest management **Research Paper RMRS** ,1998 **Integrated Analysis of Chesapeake Bay**

Monitoring Data ,1998 Numerical Ecology P. Legendre,Louis Legendre,2012-07-21 The book describes and discusses the numerical methods which are successfully being used for analysing ecological data using a clear and comprehensive approach These methods are derived from the fields of mathematical physics parametric and nonparametric statistics information theory numerical taxonomy archaeology psychometry sociometry econometry and others An updated 3rd English edition of the most widely cited book on quantitative analysis of multivariate ecological data Relates ecological questions to methods of statistical analysis with a clear description of complex numerical methods All methods are illustrated by examples from the ecological literature so that ecologists clearly see how to use the methods and approaches in their own research All calculations are available in R language functions Spatial Complexity, Informatics, and Wildlife Conservation Samuel A.

Cushman,Falk Huettmann,2009-12-21 As Earth faces the greatest mass extinction in 65 million years the present is a moment of tremendous foment and emergence in ecological science With leaps in advances in ecological research and the technical tools available scientists face the critical task of challenging policymakers and the public to recognize the urgency of our global crisis This book focuses directly on the interplay between theory data and analytical methodology in the rapidly evolving fields of animal ecology conservation and management The mixture of topics of particular current relevance includes landscape ecology remote sensing spatial modeling geostatistics genomics and ecological informatics The greatest interest to the practicing scientist and graduate student will be the synthesis and integration of these topics to provide a

composite view of the emerging field of spatial ecological informatics and its applications in research and management

Predicting Species Occurrences J. Michael Scott, Patricia Heglund, Michael L. Morrison, 2002-02 Predictions about where different species are where they are not and how they move across a landscape or respond to human activities if timber is harvested for instance or stream flow altered are important aspects of the work of wildlife biologists land managers and the agencies and policymakers that govern natural resources Despite the increased use and importance of model predictions these predictions are seldom tested and have unknown levels of accuracy Predicting Species Occurrences addresses those concerns highlighting for managers and researchers the strengths and weaknesses of current approaches as well as the magnitude of the research required to improve or test predictions of currently used models The book is an outgrowth of an international symposium held in October 1999 that brought together scientists and researchers at the forefront of efforts to process information about species at different spatial and temporal scales It is a comprehensive reference that offers an exhaustive treatment of the subject with 65 chapters by leading experts from around the world that review the history of the theory and practice of modeling and present a standard terminology examine temporal and spatial scales in terms of their influence on patterns and processes of species distribution offer detailed discussions of state of the art modeling tools and descriptions of methods for assessing model accuracy discuss how to predict species presence and abundance present examples of how spatially explicit data on demographics can provide important information for managers An introductory chapter by Michael A Huston examines the ecological context in which predictions of species occurrences are made and a concluding chapter by John A Wiens offers an insightful review and synthesis of the topics examined along with guidance for future directions and cautions regarding misuse of models Other contributors include Michael P Austin Barry R Noon Alan H Fielding Michael Goodchild Brian A Maurer John T Rotenberry Paul Angermeier Pierre R Vernier and more than a hundred others Predicting Species Occurrences offers important new information about many of the topics raised in the seminal volume Wildlife 2000 University of Wisconsin Press 1986 and will be the standard reference on this subject for years to come Its state of the art assessment will play a key role in guiding the continued development and application of tools for making accurate predictions and is an indispensable volume for anyone engaged in species management or conservation

Biogeochemical Cycling and Sediment Ecology J.

Gray, William Ambrose Jr., Anna Szaniawska, 2012-12-06 Oceanographic discontinuities e g frontal systems upwelling areas ice edges are often areas of enhanced biological productivity Considerable research on the physics and biology of the physical boundaries defining these discontinuities has been accomplished see I D The interface between water and sediment is the largest physical boundary in the ocean but has not received a proportionate degree of attention The purpose of the Nato Advanced Research Workshop ARW was to focus on soft sediment systems by identifying deficiencies in our knowledge of these systems and defining key issues in the management of coastal sedimentary habitats Marine sediments play important roles in the marine ecosystem and the biosphere They provide food and habitat for many marine organisms some of which are commercially important More importantly from a global perspective marine sediments also provide ecosystem goods and services 2J Organic matter from primary production in the water column and contaminants scavenged by particles accumulate in sediments where their fate is determined by sediment processes such as bioturbation and biogeochemical cycling Nutrients are regenerated and contaminants degraded in sediments Under some conditions carbon accumulates in coastal and shelf sediments and may be removed from the carbon cycle for millions of years having a potentially significant impact on global climate change Sediments also protect coasts The economic value of services provided by coastal areas has recently been estimated to be on the order of 12 568 9 10 y 3J far in excess of the global GNP
