Quantitative Models In Parallel Systems:

Quantitative Methods in Parallel Systems Francois Baccelli, Alain Jean-Marie, Isi Mitrani, 2013-11-11 It is widely recognized that the complexity of parallel and distributed systems is such that proper tools must be employed during their design stage in order to achieve the quantitative goals for which they are intended This volume collects recent research results obtained within the Basic Research Action Qmips which bears on the quantitative analysis of parallel and distributed architectures Part 1 is devoted to research on the usage of general formalisms stemming from theoretical computer science in quantitative performance modeling of parallel systems It contains research papers on process algebras on Petri nets and on queueing networks The contributions in Part 2 are concerned with solution techniques This part is expected to allow the reader to identify among the general formalisms of Part I those that are amenable to an efficient mathematical treatment in the perspective of quantitative information The common theme of Part 3 is the application of the analytical results of Part 2 to the performance evaluation and optimization of parallel and distributed systems Part 1 Stochastic Process Algebras are used by N Gotz H Hermanns U Herzog V Mertsiotakis and M Rettelbach as a novel approach for the structured design and analysis of both the functional behaviour and performability i e performance and dependability characteristics of parallel and distributed systems This is achieved by integrating stochastic modeling and analysis into the powerful and well investigated formal description techniques of process algebras Wireless and Satellite Systems Qihui Wu, Kanglian Zhao, Xiaojin Ding, 2021-02-27 This two volume set LNICST 357 358 constitutes the post conference proceedings of the 11th EAI International Conference on Wireless and Satellite Services WiSATS 2020 held in Nanjing China in September 2020 The 91 full papers and workshop papers were carefully reviewed and selected from 200 submissions Part I LNICST 357 details original research and results of wireless and satellite technology for a smarter global communication architecture The theme of WiSATS 2020 is Intelligent Wireless and Satellite Communications for Beyond 5G Part II LNICST 358 presents 6 workshop papers High Speed Space Communication and Space Information Networks HSSCSIN Integrated Space and Onboard Networks ISON Intelligent Satellite Operations Managements and Applications ISOMA Intelligent Satellites in Future Space Networked System ISFSNS Satellite Communications Networking and Applications SCNA Satellite Internet of Things Trusted Data Sharing Secure Communication SIOTTDSSC **Lectures on Formal Methods and Performance Analysis** Ed Brinksma, Holger Hermanns, Joost-Pieter Katoen, 2003-06-29 Traditionally models and methods for the analysis of the functional correctness of reactive systems and those for the analysis of their performance and dependability aspects have been studied by different research communities This has resulted in the development of successful but distinct and largely unrelated modeling and analysis techniques for both domains In many modern systems however the difference between their functional features and their performance properties has become blurred as relevant functionalities become inextricably linked to performance aspects e g isochronous data transfer for live video transmission During the last decade this trend has

motivated an increased interest in combining insights and results from the field of formal methods traditionally used on functionality with techniques for performance modeling and analysis. Prominent examples of this cross fertilization are extensions of process algebra and Petri nets that allow for the automatic generation of performance models, the use of formal proof techniques to assess the correctness of randomized algorithms and extensions of model checking techniques to analyze performance requirements automatically. We believe that these developments mark the beginning of a new paradigm for the modeling and analysis of systems in which qualitative and quantitative aspects are studied from an integrated perspective. We are convinced that the further work towards the realization of this goal will be a growing source of inspiration and progress for both communities.

The papers are organized in sections on symbolic verification, infinite state systems, deduction and abstraction, application of model checking techniques, timed and probabilistic systems, hardware design and verification, software verification, testing techniques and tools, implementation techniques, semantics and compositional verification, logics and model checking, and ETAPS tool demonstration.

Transactions on Petri Nets and Other Models of Concurrency I Wil M. P. van der Aalst, Jonathan Billington, 2008-11-27 These Transactions publish archival papers in the broad area of Petri nets and other models of concurrency ranging from theoretical work to tool support and industrial applications. ToPNoC issues are published as LNCS volumes and hence are widely distributed and indexed. This Journal has its own Editorial Board which selects papers based on a rigorous two stage refereeing process. ToPNoC contains Revised versions of a selection of the best papers from workshops and tutorials at the annual Petri net conferences, special sections, issues within particular subareas similar to those published in the Advances in Petri Nets series, other papers invited for publication in ToPNoC, papers submitted directly to ToPNoC by their authors. This is the first volume of ToPNoC. It contains revised and extended versions of a selection of the best papers from the workshops held at the 28th International Conference on Applications and Theory of Petri Nets and Other Models of Concurrency which took place in Siedlce, Poland, June 25-29, 2007. The material has been selected and evaluated by the two Workshop and Tutorial Chairs, Wil van der Aalst and Jonathan Billington, in close cooperation with the chairs of the individual workshops. The 13 papers in this volume cover a wide range of concurrency related topics including teaching concurrency, process languages, process mining, software engineering, state space visualization, techniques, timed Petri nets, unfolding techniques, and hardware systems. Thus, this volume gives a good overview of the state of the art in concurrency research.
