Random Descent:

A Guide to Graph Colouring R.M.R. Lewis,2015-10-26 This book treats graph colouring as an algorithmic problem with a strong emphasis on practical applications The author describes and analyses some of the best known algorithms for colouring arbitrary graphs focusing on whether these heuristics can provide optimal solutions in some cases how they perform on graphs where the chromatic number is unknown and whether they can produce better solutions than other algorithms for certain types of graphs and why The introductory chapters explain graph colouring and bounds and constructive algorithms The author then shows how advanced modern techniques can be applied to classic real world operational research problems such as seating plans sports scheduling and university timetabling He includes many examples suggestions for further reading and historical notes and the book is supplemented by a website with an online suite of downloadable code The book will be of value to researchers graduate students and practitioners in the areas of operations research theoretical computer science optimization and computational intelligence The reader should have elementary knowledge of sets matrices and enumerative combinatorics *Artificial Intelligence* David L. Poole,Alan K. Mackworth,2010-04-19 Recent decades have witnessed the emergence of artificial intelligence as a serious science and engineering discipline This textbook aimed at junior to senior undergraduate students and first year graduate students presents artificial intelligence AI using a coherent framework to study the design of intelligent computational agents By showing how basic approaches fit into a multidimensional design space readers can learn the fundamentals without losing sight of the bigger picture The book balances theory and experiment showing how to link them intimately together and develops the science of AI together with its engineering applications Although structured as a textbook the book s straightforward self contained style will also appeal to a wide audience of professionals researchers and independent learners AI is a rapidly developing field this book encapsulates the latest results without being exhaustive and encyclopedic The text is supported by an online learning environment AIspace http aispace org so that students can experiment with the main AI algorithms plus problems animations lecture slides and a knowledge representation system AIlog for experimentation and problem solving **Deep Learning in Science** Pierre Baldi,2021-07 Rigorous treatment of the theory of deep learning from first principles with applications to beautiful problems in the natural sciences *Applied Probability* Kenneth Lange,2008-01-17 Despite the fears of university mathematics departments mathematics educat ion is growing rather than declining But the truth of the matter is that the increases are occurring outside departments of mathematics Engineers computer scientists physicists chemists economists statis cians biologists and even philosophers teach and learn a great deal of mathematics The teaching is not always terribly rigorous but it tends to be better motivated and better adapted to the needs of students In my own experience teaching students of biostatistics and mathematical bi ogy I attempt to convey both the beauty and utility of probability This is a tall order partially because probability theory has its own vocabulary and habits of thought The axiomatic presentation of

advanced probability typically proceeds via measure theory This approach has the advantage of rigor but it inwitably misses most of the interesting applications and many applied scientists rebel against the onslaught of technicalities In the current book I endeavor to achieve a balance between theory and app cations in a rather short compass While the combination of brevity apd balance sacrifices many of the proofs of a rigorous course it is still cons tent with supplying students with many of the relevant theoretical tools In my opinion it better to present the mathematical facts without proof rather than omit them altogether   Evolutionary Computation in Combinatorial Optimization Francisco Chicano,Bin Hu,Pablo García-Sánchez,2016-03-15 This book constitutes the refereed proceedings of the 16th European Conference on Evolutionary Computation in Combinatorial Optimization EvoCOP 2016 held in Porto Portugal in March April 2016 co located with the Evo 2015 events EuroGP EvoMUSART and EvoApplications The 17 revised full papers presented were carefully reviewed and selected from 44 submissions The papers cover methodology applications and theoretical studies The methods included evolutionary and memetic algorithms variable neighborhood search particle swarm optimization hyperheuristics mat heuristic and other adaptive approaches Applications included both traditional domains such as graph coloring vehicle routing the longest common subsequence problem the quadratic assignment problem and new er domains such as the traveling thief problem web service location and finding short addition chains The theoretical studies involved fitness landscape analysis local search and recombination operator analysis and the big valley search space hypothesis The consideration of multiple objectives dynamic and noisy environments was also present in a number of articles
