Random Signals Estimation and Identification Nirode Mohanty, 2012-12-06 The techniques used for the extraction of information from received or observed signals are applicable in many diverse areas such as radar sonar communications geophysics remote sensing acoustics meteorology medical imaging systems and electronics warfare The received signal is usually disturbed by thermal electrical atmospheric channel or intentional interferences The received signal cannot be predicted deterministically so that statistical methods are needed to describe the signal In general therefore any received signal is analyzed as a random signal or process The purpose of this book is to provide an elementary introduction to random signal analysis estimation filtering and identification The emphasis of the book is on the computational aspects as well as presentation of common analytical tools for systems involving random signals The book covers random processes stationary signals spectral analysis estimation optimization detection spectrum estimation prediction filtering and identification The book is addressed to practicing engineers and scientists It can be used as a text for courses in the areas of random processes estimation theory and system identification by undergraduates and graduate students in engineering and science with some background in probability and linear algebra Part of the book has been used by the author while teaching at State University of New York at Buffalo and California State University at Long Beach Some of the algorithms presented in this book have been successfully applied to industrial projects

Comprising 26 chapters and ideal for coursework and self study, this extensive text provides the essential concepts of identification. Lays down the foundations of mathematical descriptions of systems, random processes and estimation in the context of identification. Discusses the theory pertaining to non parametric and parametric models for deterministic plus stochastic LTI systems in detail. Demonstrates the concepts and methods of identification on different case studies. Presents a gradual development of state space identification and grey box modeling. Offers an overview of advanced topics of identification namely the linear time varying LTV, non linear and closed loop identification. Discusses a multivariable approach to identification using the iterative principal component analysis. Embeds MATLAB codes for illustrated examples in the text at the respective points.

**Principles of System Identification: Theory and Practice** presents a formal base in LTI deterministic and stochastic systems modeling and estimation theory. It is a one stop reference for introductory to moderately advanced courses on system identification as well as introductory courses on stochastic signal processing or time series analysis. **Combined Parametric-Nonparametric Identification of Block-Oriented Systems** Grzegorz Mzyk, 2013-11-20 This book considers a problem of block oriented nonlinear dynamic system identification in the presence of random disturbances. This class of systems includes various interconnections of linear dynamic blocks and static nonlinear elements e.g. Hammerstein system, Wiener system, Wiener-Hammerstein sandwich system and additive NARMAX systems with feedback. Interconnecting signals are not accessible for measurement. The combined parametric/nonparametric algorithms proposed in the book can be selected dependently on the prior knowledge of the system and signals. Most of them are based on the decomposition of the complex system identification task into simpler local subproblems by using non parametric kernel or orthogonal regression estimation. In the parametric stage the generalized least squares or the instrumental variables technique is commonly applied to cope with correlated excitations. Limit properties of the algorithms have been shown analytically and illustrated in simple experiments

Model-Based Signal Processing James V. Candy, 2005-10-13 A unique treatment of signal processing using a model based perspective Signal processing is primarily aimed at extracting useful information while rejecting the extraneous from noisy data If signal levels are high then basic techniques can be applied However low signal levels require using the underlying physics to correct the problem causing these low levels and extracting the desired information Model based signal processing incorporates the physical phenomena measurements and noise in the form of mathematical models to solve this problem Not only does the approach enable signal processors to work directly in terms of the problem's physics instrumentation and uncertainties but it provides far superior performance over the standard techniques Model based signal processing is both a modeler's as well as a signal processor's tool Model Based Signal Processing develops the model based approach in a unified manner and follows it through the text in the algorithms examples applications and case studies The approach coupled with the hierarchy of physics based models that the author develops including linear as well as nonlinear representations makes it a unique contribution to the field of signal processing The text includes parametric e.g. autoregressive or all pole sinusoidal wave based and state space models as some of the model sets with its focus on how they may be used to solve signal processing
