

Animal Behavior session 3 readings

10.2 Individual condition and environmental factors affect territoriality

- When animals settle in an area, they establish a territory, an area defended to obtain the exclusive use of the resources it has such as food, nesting sites, or potential mates.
- Animals have to use time and energy to defend a territory
- Home range is not a territory, it is an area of repeated use that are not defended
- Home ranges can overlap while territories cannot

Body condition affects territoriality damselflies

- Aggressive behaviors require a lot of energy and one has to be healthy to be able to acquire and defend a territory
- Body condition can be measured by body mass, body size, measured of fat (extra energy storage that can be used)
- Using damselflies as an example, researchers identified and collected 30 territorial and 30 nonterritorial males of similar age
- They found that territorial males had much higher fat reserves than nonterritorial males, so territorial males have higher potential energy reserves
- To show that the energy was used to defend a territory, they captured sexually mature males and hung them with a string so they could still fly and had them intrude others' territory.
- These males were used to stimulate a long territorial contest. After the experiment, the fat reserves of the experimental males were measured and compared to nonmanipulated territorial males and nonterritorial males
- Males who had interacted with intruders had the lowest fat reserve, nonmanipulated had fat reserves 4x higher
- Conclusion: long staged contests reduced a territorial male's fat reserve to very low: aerial displays required for defending a territory are energetically very costly. Only males with high energy reserves can hold a territory
