Scientific and Technical Aerospace Reports ,1984 *The Athenaeum* ,1907 **Competition for Space and the Structure of Ecological Communities** P. Yodzis,2013-03-08 This volume is an investigation of interspecific competition for space particularly among sessile organisms both plant and animal and its consequences for community structure While my own contribution and the bulk of this volume lies in mathematical analysis of the phenomenon I have also tried to summarize the most important natural historical aspects of these communities and have devoted much effort to relating the mathematical results to observations of the natural world Thus the volume has both a synthetic and an analytic aspect On the one hand I have been struck by certain similarities among many communities from forests to mussel beds in which spatial competition is important On the other hand I have analyzed this phenomenon by means of reaction dispersal models Finally the mathematical analysis has suggested a conceptual framework for these communities which I believe further unifies and illuminates the field data A focal perception of this work is that just as niche relations provide an appropriate expression of the influence of resource competition on community structure so do dominance relations provide an appropriate expression of the influence of spatial competition **Theoretical Approaches to Complex Systems** R. Heim,G. Palm,2013-03-08

Mathematical Models in Cell Biology and Cancer Chemotherapy M. Eisen,2013-03-13 The purpose of this book is to show how mathematics can be applied to improve cancer chemotherapy Unfortunately most drugs used in treating cancer kill both normal and abnormal cells However more cancer cells than normal cells can be destroyed by the drug because tumor cells usually exhibit different growth kinetics than normal cells To capitalize on this last fact cell kinetics must be studied by formulating mathematical models of normal and abnormal cell growth These models allow the therapeutic and harmful effects of cancer drugs to be simulated quantitatively The combined cell and drug models can be used to study the effects of different methods of administering drugs The least harmful method of drug administration according to a given criterion can be found by applying optimal control theory The prerequisites for reading this book are an elementary knowledge of ordinary differential equations probability statistics and linear algebra In order to make this book self

contained a chapter on cell biology and a chapter on control theory have been included Those readers who have had some exposure to biology may prefer to omit Chapter I Cell Biology and only use it as a reference when required However few biologists have been exposed to control theory Chapter 7 provides a short coherent and comprehensible presentation of this subject The concepts of control theory are necessary for a full understanding of Chapters 8 and 9

The Golden Age of Theoretical Ecology: 1923-1940 F.M. Scudo, J.R. Ziegler, 2013-03-08 This is the part of any book where the authors usually discuss why they wrote it We hope however that the text will justify itself In fact any well trained ecologist will immediately grasp the significance of these seminal works We have therefore tried to keep our interpretive comments to a minimum Students of modern theoretical ecology will want to contrast the papers in this collection with their modern derivatives We believe that those who do so will be surprised if not amazed by the ecological sophistication and intellectual power of the earlier works They will stand as a challenge to those who study them and we hope provide a standard for the quality of their work By presenting this collection of works most of them not easily available and or for the first time in English we hope to help them attain the high level of recognition they deserve We are also enabling readers not sufficiently familiar with Italian to acquire enough of a background to properly follow the works in French not presented here by including Volterra's *Variazioni e fluttuazioni del numero d'individui in specie animali conviventi* 1927 still available in the original edition

Mathematical Aspects of Reacting and Diffusing Systems P. C. Fife, 2013-03-08 Modeling and analyzing the dynamics of chemical mixtures by means of differential equations is one of the prime concerns of chemical engineering theorists These equations often take the form of systems of nonlinear parabolic partial differential equations or reaction diffusion equations when there is diffusion of chemical substances involved A good overview of this endeavor can be had by reading the two volumes by R Aris 1975 who himself was one of the main contributors to the theory Enthusiasm for the models developed has been shared by parts of the mathematical community and these models have in fact provided motivation for some beautiful mathematical results There are analogies between chemical reactors and certain biological systems One such analogy is rather obvious a single living organism is a dynamic structure built of molecules and ions many of which react and diffuse Other analogies are less obvious for example the electric potential of a membrane can diffuse like a chemical and of course can interact with real chemical species ions which are transported through the membrane These facts gave rise to Hodgkin's and Huxley's celebrated model for the propagation of nerve signals On the level of populations individuals interact and move about and so it is not surprising that here again the simplest continuous space time interaction migration models have the same general appearance as those for diffusing and reacting chemical systems
