Rise And Fall Of Epithelial Phenotype Concepts Of Epithelial Mesenchymal Transition:

Rise and Fall of Epithelial Phenotype Pierre Savagner,2007-07-05 Epithelial phenotype is a dynamic stage of differentiation that can be modulated during several physiological or pathological events The rapid conversion to a mesenchymal like phenotype is called an epithelial mesenchymal transition EMT The Rise and Fall of Epithelial Phenotype is the first book to comprehensively introduce the concept of EMT The first part of this volume describes main examples and models and explains their physiological relevance These examples include hydra morphogenesis gastrulation in mouse drosophila and sea urchin as well as neural crest cell migration and heart morphogenesis in vertebrates Part two reviews in detail specific EMT molecular pathways covering extracellular induction transduction and transcription response and modulation of cell cell adhesion structures It emphasizes new specific pathways with potential medical applications EMTs can also be linked to pathological events such as wound healing and cancer progression as detailed in this section of the book

Ovarian Cancer M. Sharon Stack,David A. Fishman,2009-09-18 Ovarian carcinoma continues to be responsible for more deaths than all other gynecologic malignancies combined due to a continued inability to achieve detection of early rather than advanced stage disease and the lack of effective tumor specific therapeutics Ovarian carcinogenesis invasion and metastatic dissemination require a complex cascade of interrelated genetic molecular and biochemical events that regulate the neoplastic transition of normal ovarian surface epithelium This updated second edition includes exciting new advances in ovarian cancer detection and treatment and provides an analysis of current research into aspects of malignant transformation growth control and metastasis A more detailed understanding of these processes may ultimately translate into the development of novel approaches for the detection and control of ovarian cancer Ways to improve tumor uptake and penetration of drugs into solid tumors Fabrizio Marcucci, Angelo Corti, Ronald Berenson,2014-12-05 The main scope of this topic is to give an update on pharmacologic and non pharmacologic approaches to enhance uptake and penetration of cancer drugs into tumors Inadequate accumulation of drugs in tumors has emerged over the last decade as one of the main problems underlying therapeutic failure and drug resistance in the treatment of cancer Insufficient drug uptake and penetration is causally related to the abnormal tumor architecture Thus poor vascularization increased resistance to blood flow and impaired blood supply represent a first obstacle to the delivery of antitumor drugs to tumor tissue Decreased or even inverted transvascular pressure gradients compromise convective delivery of drugs Eventually an abnormal extracellular matrix offers increased frictional resistance to tumor drug penetration Abnormal tumor architecture also changes the biology of tumor cells which contributes to drug resistance through several different mechanisms The variability in vessel location and structure can make many areas of the tumor hypoxic which causes the tumor cells to become quiescent and thereby resistant to many antitumor drugs In addition the abnormally long distance of part of the tumor cell population from blood vessels provides a challenge to delivering cancer drugs to these cells We have recently proposed additional

mechanisms of tumor drug resistance which are also related to abnormal tumor architecture First increased interstitial fluid pressure can by itself induce drug resistance through the induction of resistance promoting paracrine factors Second the interaction of drug molecules with vessel proximal tumor cell layers may also induce the release of these factors which can spread throughout the cancer and induce drug resistance in tumor cells distant from blood vessels As can be seen abnormal tumor architecture inadequate drug accumulation and tumor drug resistance are tightly linked phenomena suggesting the need to normalize the tumor architecture including blood vessels and or increase the accumulation of cancer drugs in tumors in order to increase therapeutic effects Indeed several classes of drugs that we refer to as promoter drugs have been described that promote tumor uptake and penetration of antitumor drugs including those that are vasoactive modify the barrier function of tumor vessels debulk tumor cells and overcome intercellular and stromal barriers In addition also non pharmacologic approaches have been described that enhance tumor accumulation of effector drugs e g convection enhanced delivery hyperthermia etc Some drugs that have already received regulatory approval e g the anti VEGF antibody bevacizumab exert antitumor effects at least in part through normalization of the tumor vasculature and enhancement of the accumulation of effector drugs Other drugs acting through different mechanisms of action are now in clinical development e g NGR TNF in phase II III studies and others are about to enter clinical investigation e g JO 1

Proprotein Convertases

in Gynecological Cancers Daniel Bassi,2012 Gynecological cancers include neoplasias of internal female genital organs mainly ovarian endometrial and cervical tumors and cancers of the external female genital structures Current scientific evidence indicates that both up and down regulation of the expression of PCs are part of the multiple changes occurring in these gynecological tumors Nevertheless the physiological significance of this puzzling pattern of PC expression remains elusive The fact that PCs can activate both pro and anticarcinogenic substrates may indicate that the nature of the overexpressed substrates in certain cancer types could determine the final outcome i e slowing or accelerating cancer development

Bagley,2010-09-02 The fact that tumors are composed of both tumor cells and host cells has long been known These tumor associated cells include vascular endothelial cells and pericytes as well as inflammatory cells such as neutrophils monocytes macrophages mast cells and eosinophils and lymphocytes The tumor cells also interact with stromal cells and with elements of the tissue extracellular matrix What has been less appreciated is the role that these cells could have in modulating the growth invasion and metastasis of the tumor Early on the elements of what we now call the tumor microenvironment were considered to be more or less innocent bystanders to the role of the tumor cells as they grew and invaded local sites Today there is an increased understanding of the critical role of the tumor microenvironment as dramatically influencing the course of tumor development and dissemination This volume represents a superb compilation of the latest thoughts and data regarding the role of each essential component of the tumor microenvironment in cancer development and progression Perhaps the earliest recognition of the role of nonmalignant cells as cancer regulators was the recognition that lymphocytes can participate in what was termed immune surveillance in the 1960s Our understanding of tumor immunity has improved markedly since then and there are now successful clinical studies showing the potential use of immune based therapies in cancer treatment
