Semiprimeness of semigroup algebras

<https://doi.org/10.1515/math-2021-0026>

received June 5, 2020; accepted January 25, 2021

Abstract: Abundant semigroups originate from p.p. rings and are generalizations of regular semigroups. The main aim of this paper is to study the primeness and the primitivity of abundant semigroup algebras. We introduce and study \mathcal{D}^* -graphs and Fountain matrices of a semigroup. Based on \mathcal{D}^* -graphs and Fountain matrices, we determine when a contracted semigroup algebra of a primitive abundant semigroup is prime (respectively, semiprime, semiprimitive, or primitive). It is well known that for any algebra \mathcal{A} with unity, \mathcal{A} is primitive (prime) if and only if so is $M_n(\mathcal{A})$. Our results can be viewed as some kind of generalizations of such a known result. In addition, it is proved that any contracted semigroup algebra of a locally ample semigroup whose set of idempotents is locally finite (respectively, locally pseudofinite and satisfying the regularity condition) is isomorphic to some contracted semigroup algebra of primitive abundant semigroups. Moreover, we obtain sufficient and necessary conditions for these classes of contracted semigroup algebras to be prime (respectively, semiprime, semiprimitive, or primitive). Finally, the structure of simple contracted semigroup algebras of idempotent-connected abundant semigroups is established. Our results enrich and extend the related results on regular semigroup algebras.

Keywords: semigroup algebra, semiprimitive algebra, semiprime algebra, locally ample semigroup, primitive abundant semigroup, complete quiver

1 Introduction

The primitivity and the primeness are important properties in the theory of algebras. Let \mathcal{A} be an algebra over a field K . It is well known that if \mathcal{A} is semisimple as a right \mathcal{A} -module, then it must be semiprimitive (semiprime), but not every semiprimitive (semiprime) algebra is semisimple. In particular, if \mathcal{A} is a finite dimensional algebra over a field, then \mathcal{A} is semisimple if and only if it is semiprimitive (semiprime).

It is well known that the class of semiprimitive semigroup algebras has contributed to solutions of various difficult problems. For example, in [1], a semiprimitive semigroup algebra was used to answer a question of Kegel [2]: whether every ring must be nil if it is the sum of two nil or locally nilpotent subrings? The semiprimitivity of inverse semigroup algebras over a field has been investigated (see [3]). It is shown that a finite inverse semigroup algebra over a field is semisimple if and only if the group algebra of each of its maximal subgroups is semisimple (see [4, 5]). In [6], Domanov proved that if F is a field and S is an inverse semigroup such that $F[G]$ is semiprimitive for each maximal subgroup G of S , then $F[S]$ is semiprimitive. This result is also true by replacing F by an arbitrary commutative ring R with unity and replacing $F_0[S]$ by $R_0[S]$ if we let S have a zero element [7, Theorem 4.2]. These results have been generalized to rings faithfully graded by inverse semigroups (see [8–10] and [11, Section 4.3]). Recently, Ji [12], and Ji and Luo [13]

It reflects recent trends in multiplicative ideal theory and factorization theory and brings together for the first time in one volume both commutative and non-commutative perspectives on these areas which have their roots in number theory, commutative algebra and algebraic geometry. Topics discussed include topological aspects in ring theory, Prüfer domains of integer-valued polynomials and their monadic submonoids and semigroup algebras. It will be of interest to practitioners of mathematics and computer science and researchers in multiplicative ideal theory, factorization theory, number theory and algebraic geometry.
