Sequential Program Structures Jim Welsh, John Elder, David Bustard, 1984 **Fundamental Concepts in Computer Science** Erol Gelenbe, 2009 This book presents fundamental contributions to computer science as written and recounted by those who made the contributions themselves As such it is a highly original approach to a OC living historyOCO of the field of computer science The scope of the book is broad in that it covers all aspects of computer science going from the theory of computation the theory of programming and the theory of computer system performance all the way to computer hardware and to major numerical applications of computers *Programming from First Principles* Richard Bornat, 1987 **Mobile Computation with Functions** Zeliha Dilsun Kirli, 2012-12-06 Mobile Computation with Functions explores distributed computation with languages which adopt functions as the main programming abstraction and support code mobility through the mobility of functions between remote sites It aims to highlight the benefits of using languages of this family in dealing with the challenges of mobile computation The possibility of exploiting existing static analysis techniques suggests that having functions at the core of mobile code language is a particularly apt choice A range of problems which have impact on the safety security and performance are discussed It is shown that types extended with effects and other annotations can capture a significant amount of information about the dynamic behavior of mobile functions and offer solutions to the problems under investigation This book includes a survey of the languages Concurrent ML Facile and PLAN which inherit the strengths of the functional paradigm in the context of concurrent and distributed computation The languages which are defined in the subsequent chapters have their roots in these languages **Concurrency, Compositionality, and Correctness** Dennis Dams, Ulrich Hannemann, Martin Steffen, 2010-02-24 This Festschrift volume published in honor of Willem Paul de Roever contains 19 detailed papers written by the friends and colleagues of the honoree all eminent scientists in their own right These are preceded by a detailed bibliography and rounded off at the end of the book with a gallery of photographs The theme under which the papers have been collected is Concurrency Compositionality and Correctness reflecting the focus of Willem Paul de Roever s research career Topics addressed include model checking computer science and state machines ontology and mereology of domains game theory compiler correctness fair scheduling and encryption algorithms **Formal Techniques in Real-Time and Fault-Tolerant Systems** Jan Vytopil, 1991-12-11 This book presents state of the art research results in the area of formal methods for real time and fault tolerant systems The papers consider problems and solutions in safety critical system design and examine how wellthe use of formal techniques for design analysis and verification serves in relating theory to practical realities The book contains papers on real time and fault tolerance issues Formal logic process algebra and action event models are applied to specify and model qualitative and quantitative real time and fault tolerant behavior to analyze timeliness requirements and consequences of fault hypotheses to verify protocols and program code to formulate formal frameworks for development of real time and fault tolerant systems to

formulate semantics of languages The integration and cross fertilization of real time and fault tolerance issues have brought new insights in recent years and these are presented in this book

Introduction to Programming with Modula-2

Günther Blaschek, Gustav Pomberger, 2012-12-06 This book is intended for the novice as well as for the experienced programmer who wants to learn Modula 2 We do not limit ourselves to just a description of Modula 2 Instead we seek to familiarize the reader with the concept of algorithms and to show him/her how to implement algorithms in Modula 2 The programming language Modula 2 was developed by Niklaus Wirth also the father of world famous Pascal and made public in 1978 Compared to other programming languages such as Ada COBOL or PL Modula 2 is a compact language which makes it easy to learn Nevertheless Modula 2 contains all important language elements necessary for formulating complicated algorithms and for implementing the modern concepts of software engineering Modula 2 is distinguished by a systematic structure that makes it possible to write easily readable programs The language supports many of the principles of modern software engineering All this makes Modula 2 a useful instrument for an introduction to the basics of programming This textbook strives to establish a solid foundation in the techniques of programming with up to date methods of program development Use of the programming language Modula 2 is reinforced with numerous hands on exercises This book does not presuppose any knowledge of programming but it does require a certain ability in the realm of abstract thinking some pleasure in problem solving and a desire to come to terms with complex interrelationships

Mathematical Foundations of Programming Semantics

Stephen Brookes, 1994-05-20 This volume is the proceedings of the Ninth International Conference on the Mathematical Foundations of Programming Semantics held in New Orleans in April 1993 The focus of the conference series is the semantics of programming languages and the mathematics which supports the study of the semantics The semantics is basically denotation The mathematics may be classified as category theory lattice theory or logic Recent conferences and workshops

have increasingly emphasized applications of the semantics and mathematics The study of the semantics develops with the mathematics and the mathematics is inspired by the applications in semantics The volume presents current research in denotational semantics and applications of category theory logic and lattice theory to semantics Software Engineering and Knowledge Engineering W. David Hurley,1995 This volume focuses on current and future trends in the interplay between software engineering and artificial intelligence This interplay is now critical to the success of both disciplines and it also affects a wide range of subject areas The articles in this volume survey the significant work that has been accomplished describe the state of the art analyze the current trends and predict which future directions have the most potential for success Areas covered include requirements engineering real time systems reuse technology development environments and meta environments process representations safety critical systems and metrics and measures for processes and products

PARLE '93 Parallel Architectures and Languages Europe Arndt Bode,Mike Reeve,1993-06-07 Parallel processing offers a solution to the problem of providing the processing power necessary to help understand and master the complexity of natural phenomena and engineering structures By taking several basic processing devices and connecting them together the potential exists of achieving a performance many times that of an individual device However building parallel application programs is today recognized as a highly complex activity requiring specialist skills and in depth knowledge PARLE is an international European based conference which focuses on the parallel processing subdomain of informatics and information technology It is intended to become THE European forum for interchange between experts in the parallel processing domain and to attract both industrial and academic participants with a technical programme designed to provide a balance between theory and practice This volume contains the proceedings of PARLE 93 The PARLE conference came into existence in 1987 as an initiative from the ESPRIT I programme and the format was revised in 1991 92 PARLE 93 is the second conference with the new format and was held in Munich

Concurrent Constraint Programming Vijay Saraswat, 1993 Concurrent Constraint Programming introduces a new and rich class of programming languages based on the notion of computing with partial information or constraints that synthesize and extend work on concurrent logic programming and that offer a promising approach for treating thorny issues in the semantics of concurrent nondeterministic programming languages Saraswat develops an elegant and semantically tractable framework for computing with constraints emphasizing their importance for communication and control in concurrent programming languages He describes the basic paradigm illustrates its structure discusses various augmentations gives a simple implementation of a concrete language and specifies its connections with other formalisms In this framework concurrently executing agents communicate by placing and checking constraints on shared variables in a common store The major form of concurrency control in the system is through

the operations of Atomic Tell an agent may instantaneously place constraints only if they are consistent with constraints that have already been placed and Blocking Ask an agent must block when it checks a constraint that is not yet known to hold Other operations at a finer granularity of atomicity are also presented Saraswat introduces and develops the concurrent constraint family of programming languages based on these ideas shows how various constraint systems can naturally realize data structures common in computer science and presents a formal operational semantics for many languages in the concurrent constraint family In addition he provides a concrete realization of the paradigm on a sequential machine by presenting a compiler for the concurrent constraint language Herbrand and demonstrates a number of constraint based concurrent programming techniques that lead to novel presentations of algorithms for many concurrent programming problems

Paradigms of Concurrency Ryszard Janicki, Jetty Kleijn, Maciej Koutny, Łukasz Mikulski, 2022-06-06 Paradigms of Concurrency Observations Behaviours and Systems a Petri Net View Ryszard Janicki McMaster University CA Jetty Kleijn Leiden University NL Maciej Koutny Newcastle University UK Lukasz Mikulski Nicolaus Copernicus University PL Concurrency can be studied at different yet consistent levels of abstraction from individual behavioural observations via more abstract concurrent histories that can be represented by causality structures capturing invariant dependencies between executed actions to system level constructs such as Petri nets or process algebra expressions Histories can then be understood as sets of closely related observations Depending on the nature of the observed relationships between executed actions involved in a single concurrent history one may identify different concurrency paradigms underpinned by different kinds of causality structures such as partial orders This book studies fundamental mathematical abstractions to capture and relate observations histories and systems In particular taking a Petri net view we present system models fitting various concurrency paradigms and their associated causality structures
