Long-Range Ballistic Missile Defense in Europe Steven A.

Hildreth,2007 Successive U S administrations have urged the creation of an anti missile system to protect against threats from rogue states The Bush Administration believes that North Korea and Iran are strategic threats and questions whether they can be deterred by conventional means The Administration has built long range missile defense bases in Alaska and California to protect against North Korean missiles The system has been tested with mixed results and questions have been raised about its effectiveness The Administration has proposed deploying a ground based mid course defense GMD element of the larger Ballistic Missile Defense System BMDS in Europe to defend against the threat of long range missiles from Iran The system would include 10 interceptors in Poland a fixed radar installation in the Czech Republic and another forward deployed radar elsewhere in the region but closer to Iran Deployment of the European GMD capability is scheduled to be completed by 2013 at a cost of 4 04 billion

Conventional Prompt Global Strike and Long-Range Ballistic Missiles

Congressional Research Service, 2017-02-13 Conventional prompt global strike

CPGS weapons would allow the United States to strike targets anywhere on Earth in as little as an hour. This capability may bolster U.S. efforts to deter and defeat adversaries by allowing the United States to attack high value targets or fleeting targets at the start of or during a conflict. Congress has generally supported the PGS mission but it has restricted funding and suggested some changes in funding for specific programs. CPGS weapons would not substitute for nuclear weapons but would supplement U.S. conventional capabilities. They would provide a niche capability with a small number of weapons directed against select critical targets. Some analysts however have raised concerns about the possibility that U.S. adversaries might misinterpret the launch of a missile with conventional warheads and conclude that the missiles carry nuclear weapons. The U.S. Department of Defense (DOD) is considering a number of systems that might provide the United States with long range strike capabilities. The Air Force and Navy have both considered deploying conventional warheads on their long range ballistic missiles. The Navy sought to deploy conventional warheads on a small number of Trident II submarine launched ballistic missiles. In FY2008 Congress rejected the requested funding for this program but the Navy has continued to consider the possibility of deploying intermediate range technologies for the prompt strike mission. The Air Force and the Defense Advanced Research Projects Agency (DARPA) are developing a hypersonic glide delivery vehicle that could deploy on a modified Peacekeeper land based ballistic missile, a system known as the conventional strike missile (CSM). In FY2008 Congress created a single combined fund to support research and development for the CPGS mission. Congress appropriated 65.4 million for this program in FY2014, 95.6 million in FY2015 and 88.7 million in FY2016. The Obama Administration has requested 181.3 million for FY2017. When Congress reviews the budget requests for CPGS weapons it may question DOD's rationale for the mission, reviewing whether the United States might have to attack targets promptly at the start of or during a conflict when it could not rely on forward based land or naval forces. It might also review whether this capability would reduce U.S. reliance on nuclear weapons or whether, as some critics have asserted, it might upset stability and possibly increase the risk of a nuclear response to a U.S. attack. This risk derives in part from the possibility that nations detecting the launch of a U.S. PGS weapon would not be able to determine whether the weapon carried a nuclear or conventional warhead. Congress has raised concerns about this possibility in the past. While most analysts expected the Air Force to take the lead in deploying a hypersonic delivery system on a modified ballistic missile, a concept known as the conventional strike missile (CSM), tests of the hypersonic vehicle known as the HTV-2 have not succeeded. An alternative glider known as the AHW may be deployed on missiles based at sea. Congress may review other weapons options for the CPGS mission including bombers, cruise missiles and possibly scramjets or other advanced technologies. Warheads deployed on boost glide systems would not be affected by the 2010 New START Treaty because these are new types of strategic offensive arms. But those deployed in existing types of reentry vehicles on existing types of ballistic missiles would count against the treaty limits. This report will be updated as needed.

Conventional Warheads for Long-Range Ballistic Missiles, 2009. The United States has deployed

long range ballistic missiles in its strategic offensive nuclear forces for more than 40 years Recently some have proposed that the United States deploy conventional warheads on these missiles This would provide the United States with the ability to strike promptly anywhere in the world regardless of the presence of overseas bases or nearby naval forces The Air Force and Navy have both studied the possible deployment of conventional warheads on their long range ballistic missiles The Navy sought funding in FY2003 and FY2004 for research into a reentry vehicle that would be able to maneuver when approaching its target The FY2007 Defense Budget requested 127 million to pursue the deployment of conventional warheads on Trident missiles but the 109th Congress rejected most of this request the FY2008 budget requests 162 4 million The Air Force is pursuing with DARPA research into a number of technologies that might enhance the U S long range strike capability In particular it is developing a hypersonic glide vehicle known as the Common Aero Vehicle CAV that could carry conventional munitions on modified Minuteman II or Peacekeeper missiles or it could deploy these missiles with more familiar conventional warheads This effort now known as the Conventional Strike Missile CSM could serve as a follow on to the conventional Trident modification The 110th Congress is likely to review these programs again when addressing the FY2008 budget request Many have expressed concerns about the possibility that other nations such as Russia or China might misinterpret the launch of a conventionally armed ballistic missile and conclude that they are under attack with nuclear weapons The Air Force has outlined a number of measures that might reduce this risk It plans to base these missiles along the U S coast far from bases with nuclear armed ballistic missiles It also would use consultations notifications and inspections to inform others of the difference between conventional and nuclear ballistic missiles But although these measures could address some of the concerns they are not likely to eliminate the risks of misunderstandings particularly if the United States used these missiles on short notice in a crisis The Navy would not segregate its conventional missiles but would deploy them on submarines that also carry nuclear warheads but it could still notify Russia or other nations to mitigate the possibility of misunderstandings Long range ballistic missiles can bring unique capabilities to the PGS mission But these missiles are only uniquely capable if the United States must attack promptly or within hours of the start of an unanticipated conflict In any other circumstance the United States is likely to have the time to move its forces into the region Hence when deciding to fund the development of conventional warheads for long range land based or sea based missiles and whether to deploy conventional ICBMs Congress may review whether the benefits brought by these systems outweigh the risks of misunderstandings arising from their use This report will be updated as needed

The Flight Environment of

Long-range Ballistic Missiles and Glide Vehicles Kurt R. Enkenhus, 1959 The flow conditions encountered in the flight of long range ballistic missiles and glide vehicles are reviewed Flow parameters were calculated using the flight trajectory equations of Eggers Allen and Niece with a simplified atmospheric model Graphs are given indicating the relationships of aerodynamic drag and heating real gas effects and rarefied gas phenomena to vehicle trajectories The vehicle trajectories in

turn are approximately determined by a few fundamental parameters such as the range vehicle weight drag coefficient and in the case of glide vehicles the lift drag ratio It is concluded that rarefied gas effects are dominant in the decay of satellite orbits but are of little importance in most surface to surface missions The most severe environmental conditions are encountered in hypersonic continuum flow Deadly Arsenals Joseph Cirincione, Jon B. Ballistic Missiles A. J. Eggers, 1955 Abstract It is demonstrated with the aid of similitude arguments that a model fired from a hypervelocity gun upstream through a special supersonic nozzle should undergo motion and experience aerodynamic heating and resulting thermal stresses like those encountered by a long range ballistic missile entering the earth's atmosphere This combination of hypervelocity gun and supersonic nozzle is therefore termed an Atmospheric Entry Simulator *Missile defense additional knowledge needed in developing system for intercepting longrange missiles.* ,

Findings and Conclusions of the Commission to Assess the Ballistic Missile Threat to the United States United States. Congress. House. Committee on National Security, 1998 **Ballistic Missile Defense** Ayoub Vermeirsch, 2013 The ballistic missile threat is increasing both quantitatively and qualitatively and is likely to continue to do so over the next decade Current global trends indicate that ballistic missile systems are becoming more flexible mobile survivable reliable and accurate while also increasing in range A number of states are also working to increase the protection of their ballistic missiles from pre launch attack and to increase their effectiveness in penetrating missile defences Several states are also developing nuclear chemical and or biological warheads for their missiles Such capabilities could be significant sources of military advantage during a conflict But they may be equally significant in times of relative peace when they undergird efforts to coerce states near and far Regional actors such as North Korea and Iran continue to develop long range missiles that will be threatening to the United States There is some uncertainty about when and how this type of intercontinental ballistic missile ICBM threat to the U S homeland will mature but there is no uncertainty about the existence of regional threats They are clear and present The threat from short range medium range and intermediate range ballistic missiles
