Machine Learning A Theoretical Approach:

Machine Learning Balas K. Natarajan, 2014-06-28 This is the first comprehensive introduction to computational learning theory. The author's uniform presentation of fundamental results and their applications offers AI researchers a theoretical perspective on the problems they study. The book presents tools for the analysis of probabilistic models of learning tools that crisply classify what is and is not efficiently learnable. After a general introduction to Valiant's PAC paradigm and the important notion of the Vapnik Chervonenkis dimension, the author explores specific topics such as finite automata and neural networks. The presentation is intended for a broad audience; the author's ability to motivate and pace discussions for beginners has been praised by reviewers. Each chapter contains numerous examples and exercises as well as a useful summary of important results. An excellent introduction to the area suitable either for a first course or as a component in general machine learning and advanced AI courses. Also an important reference for AI researchers.

Algorithmic Learning Theory Shai Ben David, John Case, Akira Maruoka, 2004-09-23 Algorithmic learning theory is mathematics about computer programs which learn from experience This involves considerable interaction between various mathematical disciplines including theory of computation statistics and combinatorics There is also considerable interaction with the practical empirical fields of machine and statistical learning in which a principal aim is to predict from past data about phenomena useful features of future data from the same phenomena The papers in this volume cover a broad

range of topics of current research in the field of algorithmic learning theory. We have divided the 29 technical contributed papers in this volume into eight categories corresponding to eight sessions reflecting this broad range. The categories featured are Inductive Inference, Approximate Optimization Algorithms, Online Sequence Prediction, Statistical Analysis of Unlabeled Data, PAC Learning, Boosting, Statistical supervised Learning, Logic-Based Learning, and Query Reinforcement Learning. Below we give a brief overview of the field placing each of these topics in the general context of the field. Formal models of automated learning reflect various facets of the wide range of activities that can be viewed as learning. A first dichotomy is between viewing learning as an indefinite process and viewing it as a finite activity with a defined termination. Inductive Inference models focus on indefinite learning processes requiring only eventual success of the learner to converge to a satisfactory conclusion.

Algorithmic Learning Theory Naoki Abe, Roni Khardon, Thomas Zeugmann, 2003-06-30 This volume contains the papers presented at the 12th Annual Conference on Algorithmic Learning Theory ALT 2001 which was held in Washington DC USA during November 25-28 2001. The main objective of the conference is to provide an interdisciplinary forum for the discussion of theoretical foundations of machine learning as well as their relevance to practical applications. The conference was co-located with the Fourth International Conference on Discovery Science DS 2001. The volume includes 21 contributed papers. These papers were selected by the program committee from 42 submissions based on clarity, significance, originality, and relevance to theory and practice of machine learning. Additionally, the volume contains the invited talks of ALT 2001 presented by Dana Angluin of Yale University USA, Paul R. Cohen of the University of Massachusetts at Amherst USA, and the joint invited talk for ALT 2001 and DS 2001 presented by Setsuo Arikawa of Kyushu University Japan. Furthermore, this volume includes abstracts of the invited talks for DS 2001 presented by Lindley Darden and Ben Shneiderman, both of the University of Maryland at College Park USA. The complete versions of these papers are published in the DS 2001 proceedings *Lecture Notes in Artificial Intelligence* Vol 2226.

Multistrategy Learning Ryszard S. Michalski,2012-12-06 Most machine learning research has been concerned with the development of systems that implement one type of inference within a single representational paradigm Such systems which can be called monostrategy

learning systems include those for empirical induction of decision trees or rules explanation based generalization neural net learning from examples genetic algorithm based learning and others Monostrategy learning systems can be very effective and useful if learning problems to which they are applied are sufficiently narrowly defined Many real world applications however pose learning problems that go beyond the capability of monostrategy learning methods In view of this recent years have witnessed a growing interest in developing multistrategy systems which integrate two or more inference types and or paradigms within one learning system Such multistrategy systems take advantage of the complementarity of different inference types or representational mechanisms Therefore they have a potential to be more versatile and more powerful than monostrategy systems On the other hand due to their greater complexity their development is significantly more difficult and represents a new great challenge to the machine learning community Multistrategy Learning contains contributions characteristic of the current research in this area Machine Learning for Health Informatics Andreas
