Magnetic Resonance Leonidas Petrakis,J. Fraissard,2012-12-06 This volume contains the lectures presented at an Advanced Study Institute on Magnetic Resonance Techniques in Fossil Energy Problems which was held at the village of Maleme Crete in July of 1983 As of this writing a different popular attitude prevails from that when the ASI was proposed as far as how critical the world energy picture is In the popular press a panglossian attitude the petroleum glut of the 80 s has replaced the jeremiads of the 70 s a catastrophic energy crisis Yet there are certain important constants a for the foreseeable future fossil energy sources petroleum coal oil shale etc will continue to be of paramount importance and b science and technology of the highest order are needed to extend the fossil energy resource base and to utilize it in a cost effective manner that is also environmentally acceptable It is precisely this second item that this volume addresses The volume introduces the phenomenology of magnetic resonance in a unified and detailed manner starting from the behavior of spins in a magnetic field and proceeding to a density matrix consideration of the phenomena involved The various important parameters of NMR and EPR are discussed in detail as well as their significance and the information that may be obtained from their proper consideration Advanced topics are then considered including line broadening interactions coherent averaging and multiple quantum methods in NMR ENDOR electron spin echoes dynamic nuclear polarization problems of quantification 2 Dimensional NMR Mossbauer and instrumentation

Advanced Magnetic Resonance Spectroscopy Techniques and Applications Peng Cao, 2017-01-27 This dissertation Advanced Magnetic Resonance Spectroscopy Techniques and Applications by Peng Cao was obtained from The University of Hong Kong Pokfulam Hong Kong and is being sold pursuant to Creative Commons Attribution 3.0 Hong Kong License The content of this dissertation has not been altered in any way We have altered the formatting in order to facilitate the ease of printing and reading of the dissertation All rights not granted by the above license are retained by the author Abstract Magnetic resonance MR is a well known non invasive technique that provides spectra by MR spectroscopy MRS and images by magnetic resonance imaging MRI of the examined tissue with detailed metabolic structural and functional information This doctoral work is focused on advanced methodologies and applications of MRS for probing cellular and molecular changes in vivo A single voxel diffusion weighted DW MRS method was first developed for monitoring the size changes of intramyocellular lipid droplets in vivo This

DWMRS technique was then utilized for exploring the vascular origins of the functional blood oxygen level dependent BOLD signal. Magnetic resonance spectroscopic imaging MRSI enables simultaneous MRS acquisition in multiple voxels. However, MRSI is conventionally time consuming. Therefore, a compressed sensing CS method was proposed in this thesis to accelerate the acquisition speed of the in vivo MRSI. It holds the potential for promoting the realization of multiple voxel DW MRS experiments though the latter is still constrained by hardware in the present. The single voxel DW MRS method for probing lipid diffusion was first developed and evaluated in oil and muscle phantoms. The experimental sequence was demonstrated to be sensitive to diffusion restriction and free of significant artifacts. Experiments were then performed in rat hindlimb muscles in vivo. The restricted lipid diffusion behavior was characterized by apparent diffusion coefficient ADC changes and utilized for quantifying the sizes of intramyocellular lipid IMCL droplets in normal, fasting, diabetic, and obese rats. The sizes of IMCL droplets reflect their vital roles in muscle energy metabolism. The IMCL droplet size estimated by ADC here was closely correlated with that measured by transmission electron microscopy. IMCL ADC was sensitive to metabolic alterations, decreasing in the fasting and diabetic groups while increasing in the obese group. These results clearly demonstrate DW MRS as a new means to examine the dynamics of IMCL metabolism in vivo. The DW MRS technique was then utilized to characterize water ADC during neuronal activation to explore the vascular origins of the BOLD signal in rat brains. MRS experiments with acoustic stimulation were performed with a dynamic point resolved spectroscopy PRESS acquisition on conditions with or without the diffusion gradient for blood suppression in the same voxel and same experimental session, which enabled the simultaneous T2 and T2 diffusion measurements. The T2 % changes with and without diffusion gradient showed no significant difference, while the spin echo SE BOLD% T2% change significantly decreased after applying the diffusion gradient, suggesting an intravascular component in the SE BOLD signal. This intravascular component was not venous blood as the T2 of this component was comparable with the T2 of the brain tissue. These results provide new insights into the vascular origins of BOLD signals. A CS approach was developed to accelerate in vivo magnetic resonance spectroscopic imaging MRSI, which enables multi voxel MRS measurements. The CS undersampling was performed by acquiring a pseudo random and density varying subset of phase encodings. The proposed CS approach preserved the spectral and spatial resolution while substantially reduced the number of phase encodings with accelerations up to seven fold for phantom and up to six fold.
