Abstract. The paper proposes the possibility degree ranking method for interval neutrosophic numbers (INNs) from the probability viewpoint since the ranking of INNs is very important for the interval neutrosophic decision-making problems. Then, we develop an interval neutrosophic number ordered weighted averaging (INNOWA) operator and an interval neutrosophic number ordered weighted geometric (INNOWG) operator and investigate their properties, and then establish a decision-making method based on the possibility degree ranking method and the INNOWA and INNOWG operators to handle multiple attribute decision-making problems with interval neutrosophic information. Finally, an illustrative example of investment alternatives is given to demonstrate the application and effectiveness of the developed approach.

Keywords: Interval neutrosophic set, interval neutrosophic number, possibility degree, interval neutrosophic number ordered weighted averaging (INNOWA) operator, interval neutrosophic number ordered weighted geometric (INNOWG) operator, decision making

1. Introduction

The neutrosophic set proposed by Smarandache [1] is characterized by the truth-membership, the indeterminacy-membership and the falsity-membership independently, which is a powerful tool to deal with incomplete, indeterminate and inconsistent information. Recently, neutrosophic sets have become an interesting research topic and attracted widely attentions. Majumdar and Samant [9] put forward similarity and entropy measures of neutrosophic

sets. Broumi and Smarandache [12] proposed several similarity measures of neutrosophic sets. Wang et al. [2, 3] proposed the concepts of a single valued neutrosophic set (SVNS) and an interval neutrosophic set (INS), which are the subclasses of a neutrosophic set, and provided the set-theoretic operators and various properties of SVNSs and INSs. Then, some researchers have proposed some algorithms of SVNSs and INSs and applied them to decision-making problems. Ye [5] proposed a correlation coefficient between SVNSs and applied it to multiple attribute decision-making problems with single valued neutrosophic information. Biswas et al. [11] introduced a grey relational coefficient based single valued neutrosophic multiple attribute decision-making method with unknown

Multiple Attribute Decision Making Metho:

Multiple Attribute Decision Making Ching-Lai Hwang, Kwangsun Yoon, 2012-12-06 This monograph is intended for an advanced undergraduate or graduate course as well as for the researchers who want a compilation of developments in this rapidly growing field of operations research. This is a sequel to our previous work entitled *Multiple Objective Decision Making Methods and Applications A State of the Art Survey* No 164 of the Lecture Notes. The literature on methods and applications of Multiple Attribute Decision Making MADM has been reviewed and classified systematically. This study provides readers with a capsule look into the existing methods, their characteristics, and applicability to analysis of MADM problems. The basic MADM concepts are defined and a standard notation is introduced in Part I. Also introduced are foundations such as models for MADM transformation of attributes, fuzzy decision rules, and methods for assessing weight. A system of classifying seventeen major MADM methods is presented. These methods have been proposed by researchers in diversified disciplines; half of them are classical ones but the other half have appeared recently. The basic concept, the computational procedure, and the characteristics of each of these methods are presented concisely in Part II. The computational procedure of each method is illustrated by solving a simple numerical example. Part IV of the survey deals with the applications of these MADM methods.

Multiple Attribute Decision Making Gwo-Hshiung Tzeng, Jih-Jeng Huang, 2011-06-22 Decision makers are often faced with several conflicting alternatives. How do they evaluate trade-offs when there are more than three criteria? To help people make optimal decisions, scholars in the discipline of multiple criteria decision making MCDM continue to develop new methods for structuring preferences and determining the correct relative weights for criteria. A compilation of modern decision making techniques, *Multiple Attribute Decision Making Methods and Applications*, focuses on the fuzzy set approach to multiple attribute decision making MADM. Drawing on their experience, the authors bring together current methods and real-life applications of MADM techniques for decision analysis. They also propose a novel hybrid MADM model that combines DEMATEL and analytic network process ANP with VIKOR procedures. The first part of the book focuses on the theory of each method and includes examples that can be calculated without a computer, providing a complete understanding of the procedures. Methods include the analytic hierarchy process AHP, ANP, simple additive weighting method ELECTRE, PROMETHEE, the gray relational model, fuzzy integral technique, rough sets, and the structural model. Integrating theory and practice, the second part of the book illustrates how methods can be used to solve real-world MADM problems. Applications covered in the book include AHP to select planning and design services for a construction project, TOPSIS and VIKOR to evaluate the best alternative fuel vehicles for urban areas, ELECTRE to solve network design problems in urban transportation planning, PROMETHEE to set priorities for the development of new energy systems from solar thermal to hydrogen energy, Fuzzy integrals to evaluate enterprise intranet web sites, Rough sets to make decisions in insurance marketing. Helping readers understand how to apply MADM techniques to their decision making, this

book is suitable for undergraduate and graduate students as well as practitioners
