It is widely acknowledged that students' performance in mathematics is significantly affected by their mathematical anxiety. Studies on mathematical anxiety have shown that it is a state of fear or apprehension that interferes with the ability to perform mathematical tasks. This anxiety can be caused by a variety of factors, including a lack of understanding of mathematical concepts, a fear of failure, and a negative attitude towards mathematics. The purpose of this study is to investigate the relationship between mathematical anxiety and performance in mathematics. The study will involve a sample of high school students who will be asked to complete a series of mathematical tasks while their anxiety levels are monitored. The results of the study will be used to develop strategies to help students overcome their anxiety and improve their performance in mathematics.

Abstract—The purpose of this study was to determine the effect of a 12-week training program on the physical fitness of 12 healthy, sedentary men. The program consisted of three sessions per week, each lasting 45 minutes. The sessions were designed to improve cardiovascular fitness, muscular strength, and flexibility. The results of the study showed that the participants experienced significant improvements in all three areas of fitness. The mean heart rate during the sessions decreased from 145 to 135 beats per minute, indicating improved cardiovascular fitness. The mean muscle strength increased from 100 to 120 pounds, indicating improved muscular strength. The mean flexibility score increased from 10 to 15 degrees, indicating improved flexibility. These results suggest that a 12-week training program can effectively improve the physical fitness of healthy, sedentary men.

Gillette, H. Anthony Neidig, J. Iskowitz, Royce M., 1999-01-01 **Separation of a highly nonideal mixture for solvent recovery** Andreas Raab, 2003-01-15 Inhaltsangabe Abstract

The separation of complex nonideal mixtures is a common problem in the process industries. The solvent recovery is an important task for chemical engineers to minimize burden upon the environment due to exhaustive use of solvents. The recovery of the individual components is complicated by the highly nonideal features of these mixtures. The separation of such highly nonideal mixtures can be limited by the presence of azeotropes which can create distillation boundaries. These distillation boundaries are forming distillation regions which are difficult to overcome with the standard rectification. Distillation systems for these highly nonideal azeotropic mixtures are particularly difficult to design and to operate in an efficient way. In printing companies often four component mixtures of ethanol ethyl acetate isopropyl acetate and water arise as waste. A separation scheme of multicomponent azeotropic distillation is developed and successfully used for a highly nonideal quaternary mixture. The composition of the mixture in mass percent is ethanol 30% water 20% ethyl acetate 25% and isopropyl acetate with 20%. The rest of the mixture 5% consists of n propane isopropane cyclohexane and ethoxypropane. For the further investigation just the quaternary mixture is examined. Generally every component should be recovered as pure as possible from the mixture. In the mixture namely five binary and two ternary azeotropes are formed by the components. Based on the synthesis procedure proposed by Rev et al and Mizsey et al a new separation technology is developed followed up the vapor liquid liquid equilibrium behavior of the mixture. They have recommended a general framework for designing feasible schemes of multicomponent azeotropic distillation. This procedure recommends to study in detail the vapor liquid liquid equilibrium data to explore immiscibility regions azeotropic points and separatrices for ternary and quaternary regions. On the behalf of the

VLE data the set of feasible separation structures is explored This procedure is followed and a new separation structure is developed and tested experimentally First the quaternary mixture is separated into two ternary mixtures by distillation The two ternary mixtures containing ethyl acetate ethanol water and isopropyl acetate ethanol water respectively Due to the analogous behavior of the two ternary mixtures similar separation cycles can be designed The two
