Magnetic Resonance Imaging Of Carcinoma Of The Urinary Bladder:

Magnetic Resonance Imaging of Carcinoma of the Urinary Bladder Jelle O. Barentsz, Frans M. J. Debruyne, J.H.J. Ruijs, 2012-12-06 Carcinoma of the urinary bladder is a common in the USA it is the fifth most common form of cancer in males and tenth most common form of cancer in females malignant and one in which noninvasive staging by imaging plays such an important role This book presents a complete approach to MR imaging of carcinoma of the urinary bladder from a detailed discussion of the value of MRI in the diagnosis of the urinary bladder to the history of the procedure The technical discussion of the general principles of MRI including the optimal pulse sequences to be used and factors that influence the quality of images are included in this book The safety factors are also presented along with contraindications The application of a double surface coil with the field strength of 0.5T provides the fine quality of the illustrations The atlas of comparative anatomy by MRI on normal volunteers and post mortem specimens as well as MR images on patients with bladder tumors and post surgery specimens is unique The results of the clinical imaging studies in patients with carcinoma of the bladder comparing the relative value of clinical staging MR CT and lymphography are helpful in showing the advantages of MRI

Identifying Novel Biomarkers in Bladder Cancer, 2nd edition Thornsten Ecke,Thierry Massfelder,2023-07-18 Bladder cancer is one of the most common urological diseases with a high mortality rate and poor prognosis It is currently ranked as the 10th most common malignancy worldwide The majority of bladder cancer patients have been found to be diagnosed with non muscle invasive bladder cancer NMIBC and the remaining are diagnosed with muscle invasive bladder cancer MIBC Although there have been advances in the treatment and therapies provided for bladder cancer patients the survival rate remains low primarily due to recurrence and metastasis of the disease following treatment Surgical treatment is currently the most common form including radical cystectomy which is the standard form of treatment combined with neoadjuvant chemotherapy However the 5 year overall survival rate is 50% Therefore further studies are required to understand the molecular mechanisms involved in the progression of bladder cancer and identify novel biomarkers to act as a diagnostic tool for patients There have been many studies involving the detection of biomarkers in bladder cancer in addition to monitoring disease recurrence to understand the impact and predict potential outcomes A variety of urine biomarkers have been developed to detect bladder cancer and prognostic risk stratification including mutational DNA and the levels of RNA expression Circulating tumor cells have also been identified as a potential biomarker for bladder cancer patients However there are significant challenges as bladder cancer has demonstrated high levels of cellular and molecular heterogeneity and some markers do not have sufficient sensitivity for accurate detection Therefore further studies are required to continue to identify new novel biomarkers for bladder cancer The aim of this Research Topic is to discuss novel biomarkers in bladder cancer and how it impacts the disease progression and the survival rate for bladder cancer patients

Principles of Medical Therapy in Pregnancy Norbert Gleicher, 2012-12-06 Prefaces of textbooks are generally meant to give editors an opportunity to express the rationale for the creation of yet another textbook It is rare to find an author or editor who does not believe that his/her book fills a very specific need This editor is no exception With the incredible proliferation of medical textbooks in recent years it has become difficult to find an empty niche for yet another text Nevertheless the editors and authors of *Principles of Medical Therapy in Pregnancy* have been impressed by one very clearly appreciated void While the association of medical disorders with pregnancy is increasing in frequency as improved medical care allows more patients with medical diseases to conceive an authoritative text covering the issue comparable to an authoritative text in internal medicine has been missing With pregnancy representing a very specific disease situation different from the nonpregnant state in diagnosis management and course of disease a detailed textbook addressing all these issues for both the internist and the obstetrician seemed urgently needed

Abdominal and Pelvic MRI A. Heuck, M. Reiser, 2012-12-09 While MRI has proved itself to be an excellent diagnostic noninvasive modality for imaging of the brain medulla and musculoskeletal system due to its high intrinsic contrast resolution and tissue characterisation potential based on the judicious application of specific sequences this has not been the case in the abdomen and pelvis The reasons are the long exposure time and the lower spatial resolution inherent to MRI However during recent years considerable progress has been achieved in MRI of the abdominal and pelvic organs due to the development of new and more rapid imaging sequences and the routine clinical application of specific magnetic resonance contrast media Consequently for some anatomical areas such as the female genital organs and the biliary system MRI is already the best performing morphological diagnostic modality However the question arises as to whether MRI given its performance capabilities should not also be considered a primary diagnostic modality for the study of parenchymal organs like the liver spleen and pancreas and not merely as a complementary modality to

solve residual problems after ultrasonography and computed tomography have been performed Although the future role of MRI in respect of the gastrointestinal tube itself is still somewhat unclear some possibilities for routine clinical use are becoming visible even in this abdominal field
