Olefin Metathesis in Supramolecular and Ring-opening

Polymerization Jedidiah M. Hastings, 2006 ABSTRACT The need to develop dynamic materials that are capable of changing their properties in response to a changing environment has grown significantly over the past decade As a result new approaches to the synthesis of these smart materials are constantly being illuminated Olefin metathesis has recently been elevated to the forefront of this area as it has proven a reliable and versatile method for creating new carbon carbon bonds This allows for the incorporation of diverse functionality without a corresponding increase in synthetic difficulty or complexity The work presented in this dissertation focuses on the creation of dynamic libraries of supramolecular polymers via olefin cross metathesis The polymers are synthesized from cytosine or easily prepared 2,4-diaminotriazines Functional groups ranging from aromatic systems alkanes and amino acids have been incorporated onto the backbones without altering the synthetic strategy Binding constants have been found to be similar in strength to related compounds In addition to the creation of supramolecular polymers olefin metathesis has been used in this study to create designer polymers with a traditional covalently bound backbone These polymers have contained functionality ranging from chiral diols which were shown to direct the stereochemistry of Grignard reactions to nucleic acid bases which can interact with their environment via Hydrogen bonding Ring opening metathesis polymerization was used to create the designer polymers from norbornene derived bicyclic ring systems The chiral diols were prepared from commercially available diethyl L tartrate The nucleic acid bases were cytosine and adenine Efforts have been started toward the incorporation of guanine and thymine

 Kohtaro Osakada, 2014-07-15 This compilation provides advanced graduate students and researchers with a structured overview of olefin polymerization. Divided into eight chapters written by international experts, this book covers polymerization using various organotransition metal catalysts, including early and late transition metal complexes, new trends in olefin oligomerization and related reactions. All authors address the historic and scientific backgrounds of the field as well as current research progress and potential for further research. The complete book is designed to present eight independent lectures, and because all authors are well versed in organometallic chemistry, each is based on a profound understanding of the reactions and structures of organotransition metal complexes. This book is an ideal accompaniment for researchers taking courses in olefin polymerization and also serves as a valuable resource for teachers and lecturers of chemistry when planning and researching material for advanced lecture courses. *Stereoselective Polymerization with Single-Site Catalysts* Lisa S.
