A. HARAUX^(*)

1. GENERALITIES

Let Ω be a bounded open domain in \mathbb{R}^n , $n \geq 1$ and f, g two odd functions: $\mathbb{R} \rightarrow \mathbb{R}$ such that,

$$(1.1) \quad f \in C^1(\mathbb{R}), \quad f' \geq 0$$

$$(1.2) \quad g \text{ is continuous and non-decreasing.}$$

The partial differential equation

$$(1.3) \quad \begin{cases} \frac{\partial^2 u}{\partial t^2} - \Delta u + f(u) + g\left(\frac{\partial u}{\partial t}\right) = h(t, x), & (t, x) \in \mathbb{R}^+ \times \Omega \\ u(t, x) = 0 & (t, x) \in \mathbb{R}^+ \times \partial\Omega \end{cases}$$

represents the small oscillations of an n -dimensional membrane with fixed edge $\{0\} \times \partial\Omega$ under the action of 4 forces

- The elastic (global, distributed) force represented by Δu .
- A non linear restoring force $-f(u)$, of local character.
- A damping force $-g\left(\frac{\partial u}{\partial t}\right)$, possibly non linear, also of local character.
- An exterior time-dependent force density $h(t, x)$.

The physical interpretation of (1.3) suggests that the initial value problem must be well set in the function space $C(\mathbb{R}^+, H_0^1(\Omega)) \cap C^1(\mathbb{R}^+, L^2(\Omega))$ and that the total energy given by

$$(1.4) \quad E(t) = \int_{\Omega} \left\{ \frac{1}{2} \left(\frac{\partial u}{\partial t} \right)^2 + \frac{1}{2} |\Delta u|^2 + \int_0^{u(t, x)} f(s) ds \right\} dx$$

must play an important role in the definition of solutions to (1.3).

Equation (1.3) has been studied by a number of authors since 1953. More precisely, the initial-value problem has been studied successively

Semilinear Hyperbolic Problems In Bounded Domains:

Semi-Linear Hyperbolic Problems in Bounded Domains Alain Haraux, 1987-01-01 The opening chapter provides background information on the basic functional setting semi groups and the abstract wave equation almost periodicity and the wave equation and technical tools Succeeding chapters cover the initial value problem asymptotics in autonomous cases non resonance in the purely dissipative case stability of periodic and almost periodic solutions oscillation properties in the conservative case and global properties of the full equation Includes bibliographic references and indexes by author and subject , *From Finite to Infinite Dimensional Dynamical Systems* James Robinson, Paul Glendinning, 2001-05-31 This volume contains six papers originally presented at a NATO Advanced Study Institute held in Cambridge U K in 1995 on the fundamental properties of partial differential equations and modeling processes involving spatial dynamics The contributors from academic institutions in Europe and the U S discuss such topics as lattice dynamical systems low dimensional models of turbulence and nonlinear dynamics of extended systems The volume is not indexed c Book News Inc **Mathematical Analysis of Deterministic and Stochastic Problems in Complex Media Electromagnetics** G. F. Roach, I. G. Stratis, A. N. Yannacopoulos, 2012-03-04 Electromagnetic complex media are artificial materials that affect the propagation of electromagnetic waves in surprising ways not usually seen in nature Because of their wide range of important applications these materials have been intensely studied over the past twenty five years mainly from the perspectives of physics and engineering But a body of rigorous mathematical theory has also gradually developed and this is the first book to present that theory Designed for researchers and advanced graduate students in applied mathematics electrical engineering and physics this book introduces the electromagnetics of complex media through a systematic state of the art account of their mathematical theory The book combines the study of well posedness homogenization and controllability of Maxwell equations complemented with constitutive relations describing complex media The book treats deterministic and stochastic problems both in the frequency and time domains It also covers computational aspects and scattering problems among other important topics Detailed appendices make the book self contained in terms of mathematical prerequisites and accessible to engineers and physicists as well as mathematicians **Energy Methods in Continuum Mechanics** S.N. Antontsev, J.I. Díaz, S.I. Shmarev, 2012-12-06 This volume contains the proceedings of the Workshop Energy Methods for Free Boundary Problems in Continuum Mechanics held in Oviedo Spain from March 21 to March 23 1994 It is well known that the conservation laws and the constitutive equations of Continuum Mechanics lead to complicated coupled systems of partial differential equations to which as a rule one fails to apply the techniques usually employed in the studies of scalar uncoupled equations such as for instance the maximum principle The study of the qualitative behaviour of solutions of the systems requires different techniques among others the so called Energy Methods where the properties of some integral of a nonnegative function of one or several unknowns allow one to arrive at important conclusions on the involved unknowns This volume presents the

state of the art in such a technique A special attention is paid to the class of Free Boundary Problems The organizers are pleased to thank the European Science Foundation Pro gram on Mathematical treatment of free boundary problems the DGICYT Spain the FICYT Principado de Asturias Spain and the Universities of Oviedo and Complutense de Madrid for their generous financial support Finally we wish to thank Kluwer Academic Publishers for the facilities received for the publication of these Proceedings

Attractors Under Autonomous and Non-autonomous Perturbations Matheus C. Bortolan,Alexandre N. Carvalho,José A. Langa,2020-05-29 This book provides a comprehensive study of how attractors behave under perturbations for both autonomous and non autonomous problems Furthermore the forward asymptotics of non autonomous dynamical systems is presented here for the first time in a unified manner When modelling real world phenomena imprecisions are unavoidable On the other hand it is paramount that mathematical models reflect the modelled phenomenon in spite of unimportant neglectable influences discounted by simplifications small errors introduced by

empirical laws or measurements among others The authors deal with this issue by investigating the permanence of dynamical structures and continuity properties of the attractor This is done in both the autonomous time independent and non autonomous time dependent framework in four distinct levels of approximation the upper semicontinuity lower semicontinuity topological structural stability and geometrical structural stability This book is aimed at graduate students and researchers interested in dissipative dynamical systems and stability theory and requires only a basic background in metric spaces functional analysis and for the applications techniques of ordinary and partial differential equations
