Statistical Models Based on Counting Processes Per K. Andersen, Ornulf Borgan, Richard D. Gill, Niels Keiding, 2012-12-06 Modern survival analysis and more general event history analysis may be effectively handled in the mathematical framework of counting processes stochastic integration martingale central limit theory and product integration This book presents this theory which has been the subject of an intense research activity during the past one and a half decades The exposition of the theory is integrated with careful presentation of many practical examples almost exclusively from the authors own experience with detailed numerical and graphical illustrations Statistical Models Based on Counting Processes may be viewed as a research monograph for mathematical statisticians and biostatisticians although almost all methods are given in concrete detail to be used in practice by other mathematically oriented researchers studying event histories demographers econometricians epidemiologists actuarial mathematicians reliability engineers and biologists Much of the material has so far only been available in the journal literature if at all and so a wide variety of researchers will find this an invaluable survey of the subject This book is a masterful account of the counting process approach is certain to be the standard reference for the area and should be on the bookshelf of anyone interested in event history analysis International Statistical Institute Short Book Reviews this impressive reference which contains a wealth of powerful mathematics practical examples and analytic insights as well as a complete integration of historical developments and recent advances in event history analysis Journal of the American Statistical Association

Missing and Modified Data in Nonparametric Estimation Sam Efromovich, 2018-03-12 This book presents a systematic and unified approach for modern nonparametric treatment of missing and modified data via examples of density and hazard rate estimation nonparametric regression filtering signals and time series analysis All basic types of missing at random and not at random biasing truncation censoring and measurement errors are discussed and their treatment is explained Ten chapters of the book cover basic cases of direct data biased data nondestructive and destructive missing survival data modified by truncation and censoring missing survival data stationary and nonstationary time series and processes and ill posed modifications The coverage is suitable for self study or a one semester course for graduate students with a prerequisite of a standard course in introductory probability Exercises of

various levels of difficulty will be helpful for the instructor and self study The book is primarily about practically important small samples It explains when consistent estimation is possible and why in some cases missing data should be ignored and why others must be considered If missing or data modification makes consistent estimation impossible then the author explains what type of action is needed to restore the lost information The book contains more than a hundred figures with simulated data that explain virtually every setting claim and development The companion R software package allows the reader to verify reproduce and modify every simulation and used estimators This makes the material fully transparent and allows one to study it interactively Sam Efromovich is the Endowed Professor of Mathematical Sciences and the Head of the Actuarial Program at the University of Texas at Dallas He is well known for his work on the theory and application of nonparametric curve estimation and is the author of *Nonparametric Curve Estimation Methods Theory and Applications* Professor Sam Efromovich is a Fellow of the Institute of Mathematical Statistics and the American Statistical Association

Vincent Poor, 2012-12-06 The areas of communications computer networks and signal processing have undergone rapid development over the past several years The advent of VLSI circuitry and increasingly sophisticated computer hardware and software techniques have made possible the construction of systems and signal processors for communications applications not contemplated only a short time ago The increasing complexity of communication systems both by themselves and in land based or satellite networks has created a greater need for finding useful mathematical techniques for their analysis The rapidly evolving technologies involved continue to find exciting new areas for application and it remains a challenge for researchers to keep abreast of developments In this volume researchers from a broad cross section of the areas of communications signal processing and computer networks have been invited to contribute articles to assist readers in learning about the current state of research and future research directions in their area The authors were not given tight guidelines for their contributions and thus the character and emphasis of each chapter differs Although the scope of the areas considered is necessarily limited in a volume of this size the coverage here is quite broad and it is hoped that the reader will find the contents of this volume to be interesting useful and informative Breakthroughs in Statistics Samuel Kotz, Norman L. Johnson, 2012-12-06 This is a two volume collection of seminal papers in the statistical sciences written during the past 100 years These papers have each had an outstanding influence on the development of statistical theory and practice over the last century Each paper is preceded by an introduction written by an authority in the field providing background information and assessing its influence Readers will enjoy a fresh outlook on now well established features of statistical techniques and philosophy by becoming acquainted with the ways they have been developed It is hoped that some readers will be stimulated to study some of the references provided in the Introductions and also in the papers

themselves and so attain a deeper background knowledge of the basis of their work

Artificial Intelligence, Big Data and Data Science in Statistics Ansgar Steland, Kwok-Leung Tsui, 2022-11-15 This book discusses the interplay between statistics data science machine learning and artificial intelligence with a focus on environmental science the natural sciences and technology It covers the state of the art from both a theoretical and a practical viewpoint and describes how to successfully apply machine learning methods demonstrating the benefits of statistics for modeling and analyzing high dimensional and big data The book's expert contributions include theoretical studies of machine learning methods expositions of general methodologies for sound statistical analyses of data as well as novel approaches to modeling and analyzing data for specific problems and areas In terms of applications the contributions deal with data as arising in industrial quality control autonomous driving transportation and traffic chip manufacturing photovoltaics football transmission of infectious diseases Covid 19 and public health The book will appeal to statisticians and data scientists as well as engineers and computer scientists working in related fields or applications

U-Statistics A J. Lee, 2019-03-13 In 1946 Paul Halmos studied unbiased estimators of minimum variance and planted the seed from which the subject matter of the present monograph sprang The author has undertaken to provide experts and advanced students with a review of the present status of the evolved theory of U statistics including applications to indicate the range and scope of U statistic methods Complete with over 200 end of chapter references this is an invaluable addition to the libraries of applied and theoretical statisticians and mathematicians

Non-Parametric Statistical Diagnosis E. Brodsky, B.S. Darkhovsky, 2013-03-14 This book has a distinct philosophy and it is appropriate to make it explicit at the outset In our view almost all classic statistical inference is based upon the assumption explicit or implicit that there exists a fixed probabilistic mechanism of data generation Unlike classic statistical inference this book is devoted to the statistical analysis of data about complex objects with more than one probabilistic mechanism of data generation We think that the existence of more than one data generation process DGP is the most important characteristic of complex systems When the hypothesis of statistical homogeneity holds true i.e. there exists only one mechanism of data generation all statistical inference is based upon the fundamental laws of large numbers However the situation is completely different when the probabilistic law of data generation can change in time or in the phase space In this case all data obtained must be sorted in subsamples generated by different probabilistic mechanisms Only after such classification we can make correct inferences about all DGPs There exists yet another type of problem for complex systems Here it is important to detect possible but unpredictable changes of DGPs on line with data collection Since the complex system can change the probabilistic mechanism of data generation the correct statistical analysis of such data must begin with decisions about possible changes in DGPs
