**Sea-level Change in Mesolithic Southern Scandinavia** Peter Moe Astrup, 2018-12-17 The

seabed in southern Scandinavia contains numerous traces of a submerged landscape that is thought to be the remnant of a once important habitat for Mesolithic hunter gatherers. Large parts of this landscape were gradually flooded by rising seas between 9500 and 4000 BC and perceptions of the Maglemose culture 9500-6400 BC have consequently been based almost exclusively on former inland settlements. As a result, Early and Late Mesolithic societies have been understood as almost diametrically opposed with regards to their reliance upon marine resources and their degree of sedentism. The main objective of the book is to investigate two questions that are directly related to our current understanding of the populations of the now submerged areas: 1. Do we have a representative picture of the spread of Early Mesolithic sites in southern Scandinavia or does the weighting towards inland sites reflect the fact that coastal sites have not been identified below present day sea level? 2. How did sea level changes impact Mesolithic populations at different temporal and spatial scales and how were these experienced from 8000-4000 BC? The book presents an extensive and up to date review of various types of evidence from the Boreal period such as faunal remains, fishing instruments,  $\delta^{13}C$  values in bones, settlement positions and available marine resources. These are used to discuss the extent to which marine resources were utilised in the Maglemose culture. Another central component of this book is a series of new coastline models made to determine the Mesolithic sea level changes, coastline positions. The eight new coastline models are created to facilitate new evaluations of possible relationships between sea level changes and cultural changes. On the basis of the new coastline models, the book also presents the preliminary results of 47 diver investigations conducted with the aim of identifying potential coastal settlements from the Maglemose culture.

*Elements of Physical Oceanography*, 2009-08-26. *Elements of Physical Oceanography* is a derivative of the *Encyclopedia of Ocean Sciences* Second Edition and serves as an important reference on current physical oceanography knowledge and expertise in one convenient and accessible source. Its selection of articles, all written by experts in their field, focuses on ocean physics: air-sea transfers, waves, mixing, ice, and the processes of transfer of properties such as heat, salinity, momentum, and dissolved gases within and into the ocean. *Elements of Physical Oceanography* serves as an ideal reference for topical research. References related to articles in physical oceanography facilitate further research. Richly illustrated with figures and tables that aid in understanding key concepts. *Encyclopedia of Modern Coral Reefs* David Hopley, 2010-11-26. Coral reefs are the largest landforms built by plants and animals. Their study therefore incorporates a wide range of disciplines. This encyclopedia approaches coral reefs from an earth science perspective, concentrating especially on modern reefs. Currently, coral reefs are under high stress, most prominently from climate change, with changes to water temperature, sea level, and ocean acidification, particularly damaging. Modern reefs have evolved through the massive environmental changes of the Quaternary, with long periods of exposure during glacially lowered sea level periods and short periods of interglacial growth. The entries in this encyclopedia condense

the large amount of work carried out since Charles Darwin first attempted to understand reef evolution. Leading authorities from many countries have contributed to the entries covering areas of geology, geography and ecology, providing comprehensive access to the most up to date research on the structure, form and processes operating on Quaternary coral reefs.

**Encyclopedia of Paleoclimatology and Ancient Environments** Vivien Gornitz, 2008-10-31. One of Springer's Major Reference Works, this book gives the reader a truly global perspective. It is the first major reference work in its field. Paleoclimate topics covered in the encyclopedia give the reader the capability to place the observations of recent global warming in the context of longer term natural climate fluctuations. Significant elements of the encyclopedia include recent developments in paleoclimate modeling, paleo ocean circulation as well as the influence of geological processes and biological feedbacks on global climate change. The encyclopedia gives the reader an entry point into the literature on these and many other groundbreaking topics.

Sea Level Change and Maritime Boundaries Antoine Grima, 2023-06-23. Climate change is modifying in varying measure the coastal geography of States. The phenomenon is not temporary but is expected to carry on during the 21st century and beyond. A distinctive feature of modern international law is the concept of maritime zones. Each maritime area is subject to an intricate scheme of States' rights and obligations. Coastal geography is a fundamental component of a long standing method developed and agreed upon between States to establish the outward limits of these areas. A feature of this method is the baseline. In international law it is the only reference line from where the outward limits of maritime zones are measured. There are clear rules on how this is established along a coast. There is a concern amongst a number of States that rising sea water levels as a result of climate change may compel them to shift their baselines inward, thus affecting the outward limits of their maritime zones. It is clear that the stability of maritime boundaries is put into question and this may bring about serious political, legal and economic repercussions. This concern may also affect the outcome of dispute settlement procedures before a competent international court or tribunal, the purpose of which is to resolve overlapping maritime claims. Key questions emerge: What is the role played by coastal geography in the legal regime determining the outward limits of maritime zones? What are the consequences of changes to coastal geography? To what extent are dispute settlement procedures before a Court or Tribunal immune from this concern? Is international law able to address this? If so, in what way and what are its limits? What can be done to resolve this?

Shortly after the creation of the Vrije Universiteit Brussel (Free University Brussels) in 1970, currently labelled as VUB, a Department of Quaternary Geology was installed within the Faculty of Science in 1974. At the beginning it dealt mainly with the study of periglacial loess deposits of the Pleistocene Glacial Period in Central Belgium and with coastal deposits in relation to sea level rise during the warm Holocene period covering the last 10 000 years in which the dawn of civilization took place step by step. Today the same research teams widen their scope of interest; they are presently studying
