The Earthquake Observers Deborah R. Coen, 2012-12-10 Earthquakes have taught us much about our planet's hidden structure and the forces that have shaped it. This knowledge rests not only on the recordings of seismographs but also on the observations of eyewitnesses to destruction. During the nineteenth century a scientific description of an earthquake was built of stories from as many people in as many situations as possible. Sometimes their stories told of fear and devastation, sometimes of wonder and excitement. In *The Earthquake Observers* Deborah R. Coen acquaints readers not only with the century's most eloquent seismic commentators including Alexander von Humboldt, Charles Darwin, Mark Twain, Charles Dickens, Karl Kraus, Ernst Mach, John Muir, and William James but also with countless other citizen observers, many of whom were women. Coen explains how observing networks transformed an instant of panic and confusion into a field for scientific research, turning earthquakes into natural experiments at the nexus of the physical and human sciences. Seismology abandoned this project of citizen science with the introduction of the Richter Scale in the 1930s, only to revive it in the twenty-first century in the face of new hazards and uncertainties. *The Earthquake Observers* tells the history of this interrupted dialogue between scientists and citizens about living with environmental risk.

Information Processing in Medical Imaging Michael F. Insana, Richard M. Leahy, 2003-06-29 This book constitutes the refereed proceedings of the 17th International Conference on Information Processing in Medical Imaging (IPMI 2001) held in Davis, CA, USA, in June 2001. The 54 revised papers presented were carefully reviewed and selected from 78 submissions. Understanding Vision Li Zhaoping, 2014-05-08 While the field of vision science has grown significantly in the past three decades, there have been few comprehensive books that showed readers how to adopt a computational approach to understanding visual perception along with the underlying mechanisms in the brain. *Understanding Vision* explains the computational principles and models of biological visual processing and, in particular, of primate vision. The book is written in such a way that vision scientists unfamiliar with mathematical details should be able to conceptually follow the theoretical principles and their relationship with physiological, anatomical, and psychological observations without going through the more mathematical pages. For those with a physical science background, especially those from machine vision, this book serves as an analytical introduction to biological vision. It can be used as a textbook or a reference book in a vision course or a computational neuroscience course for graduate students or advanced undergraduate students. It is also suitable for self-learning by motivated readers. In addition, for those with a focused interest in just one of the topics in the book, it is feasible to read just the chapter on this topic without having read or fully comprehended the other chapters. In particular, Chapter 2 presents a brief overview of experimental observations on biological vision. Chapter 3 is on encoding of visual inputs. Chapter

5 is on visual attentional selection driven by sensory inputs and Chapter 6 is on visual perception or decoding Including many examples that clearly illustrate the application of computational principles to experimental observations Understanding Vision is valuable for students and researchers in computational neuroscience vision science machine and computer vision as well as physicists interested in visual processes

Indoor Scene Recognition by 3-D Object Search Pascal

Meißner,2019-10-11 This book focuses on enabling mobile robots to recognize scenes in indoor environments in order to allow them to determine which actions are appropriate at which points in time In concrete terms future robots will have to solve the classification problem represented by scene recognition sufficiently well for them to act independently in human centered environments To achieve accurate yet versatile indoor scene recognition the book presents a hierarchical data structure for scenes the Implicit Shape Model trees Further it also provides training and recognition algorithms for these trees In general entire indoor scenes cannot be perceived from a single point of view To address this problem the authors introduce Active Scene Recognition ASR a concept that embeds canonical scene recognition in a decision making system that selects camera views for a mobile robot to drive to so that it can find objects not yet localized The authors formalize the automatic selection of camera views as a Next Best View NBV problem to which they contribute an algorithmic solution which focuses on realistic problem modeling while maintaining its computational efficiency Lastly the book introduces a method for predicting the poses of objects to be searched establishing the otherwise missing link between scene recognition and NBV estimation

Human-Computer Interaction - INTERACT 2009 Tom Gross,Jan Gulliksen,Paula Kotzé,Lars Oestreicher,Philippe Palanque,Raquel Oliveira Prates,Marco Winckler,2009-08-20 INTERACT 2009 was the 12th of a series of INTERACT international conferences supported by the IFIP Technical Committee 13 on Human Computer Interaction This year INTERACT was held in Uppsala Sweden organized by the Swedish Interdisciplinary Interest Group for Human Computer Interaction STIMDI in cooperation with the Department of Information Technology at Uppsala University Like its predecessors INTERACT 2009 highlighted both to the academic and to the industrial world the importance of the human computer interaction HCI area and its most recent breakthroughs on current applications Both experienced HCI researchers and professionals as well as newcomers to the field interested in designing or evaluating interactive software developing new interaction technologies or investigating overarching theories of HCI found in INTERACT 2009 a great forum for communication with people of similar interests to encourage collaboration and to learn INTERACT 2009 had Research and Practice as its special theme The reason we selected

this theme is that the research within the field has drifted away from the practical applicability of its results and that the HCI practice has come to disregard the knowledge and development within the academic community

Vision Models for Target Detection and Recognition Eli Peli, 1995 This book is an international collection of contributions from academia, industry and the armed forces. It addresses current and emerging Spatial Vision Models and their application to the understanding, prediction and evaluation of the tasks of target detection and recognition. The discussion in many of the chapters is framed in terms of military targets and military vision aids. However, the techniques, analyses and problems are by no means limited to this area of application. The detection and recognition of an armored vehicle from a reconnaissance image are performed by the same visual system used to detect and recognize a tumor in an X-ray. The analysis of the interaction of the human visual system with night vision devices is not different from the analysis needed in the case of an operator examining structures using a remote endoscopic camera etc. The book is organized into three general sections. The first covers basic modeling of central foveal vision and its theoretical background. The second is centered on the evaluation of model performance in applications while the third is dedicated to aspects of peripheral vision modeling and the expansion of peripheral modeling to include visual search
