

Total Sediment Thickness of the World's Oceans & Marginal Seas

A digital total sediment thickness database for the world's oceans and marginal seas is being compiled by the National Geophysical Data Center (NGDC), Marine Geology & Geophysics Division. The data are gridded with a spacing of 3 arc-minutes by 3 arc-minutes. Sediment thickness data were compiled from three principle sources previously published: isopach maps; ocean drilling results, both ODP and IODP; and seismic reflection profiles archived at NGDC as well as seismic data and isopach maps available as part of the IOC's Geological/Geophysical Atlas of the Pacific (GAPAP) project.

The distribution of sediments in the oceans is controlled by five primary factors:

- 1) Age of the underlying crust
- 2) Tectonic history of the ocean crust
- 3) Structural trends in basement
- 4) Nature and location of sediment sources, and
- 5) The nature of the sedimentary processes delivering sediments to deposition

The data values are in meters and represent the depth to acoustic basement. It should be noted that acoustic basement may not actually represent the base of the sediments. These data are intended to provide a minimum value for the thickness of the sediment in a particular geographic region.

Sedimentation In The World Ocean:

Metalliferous Sediments of the World Ocean Evgeny G. Gurvich, 2006-01-16 Dramatic advances in understanding global tectonics have been made in the last half century and the information and specific data acquired on the floor of the World Ocean by the scientific community probably has exceeded that available in all previous time. With the benefit of new technology and advanced concepts in the earth sciences extensive exploration of the deep seabed became possible and has been carried out in many parts of the world. Many features have been recognized and data recorded that are vital for understanding the fundamental processes that shape the earth's surface and control the habitable environment. The data collected to date on the ocean floor and its physical environment greatly exceeds our understanding and appreciation of their fundamental importance in the earth sciences and our ability to apply this knowledge effectively in improving our way of life. With his extensive scientific knowledge and unique experience from many cruises in association with scientists throughout the world Dr Evgeny Gurvich has made an outstanding contribution in acquiring basic data on hydrothermal and sedimentation processes in the ocean as well as in the synthesis of data and concepts available from cruise reports and an extensive literature. *Sedimentation in the World Ocean with Emphasis on the Nature, Distribution and Behavior of Marine*

Suspensions Aleksandr Petrovich Lisitsyn, 1972 **Sea-Ice and Iceberg Sedimentation in the Ocean** Alexander P. Lisitsyn, 2012-12-06 In many geological epochs glacial sediments are widespread. This type of sedimentation results from the interaction between atmosphere, cryosphere, hydrosphere and biosphere under temperatures ranging from 0 to 80. Two types of glacial sediments exist: those from sea ice and those from icebergs. Both types can be subdivided into various subfacies. Most widespread in the Northern Hemisphere is the Siberian subfacies characterized by silt and clay and often misinterpreted as sediments of temperate zones. This reference book for researchers working on this kind of sediments provides a complete overview of the various glacial deposits in the ocean. **Sedimentation Processes in the White Sea**

Alexander P. Lisitsyn, Liudmila L. Demina, 2019-01-22 This book presents a new perspective on the sedimentation processes in the White Sea based on a multidisciplinary research study conducted between 2001 and 2016. It provides a comprehensive review and discusses the latest research findings on the ecosystem of this sub-arctic zone. The topics addressed include suspended particulate matter as a main source and proxy of the sedimentation processes in the White Sea; vertical fluxes of dispersed sedimentary matter and absolute masses in the White Sea; and the development history and quaternary deposits of the modern White Sea basin. The authors closely examine the abundance and species composition of microalgae associations and the environmental conditions in the bottom sediments of the White Sea, namely heavy metal accumulation and aliphatic and polycyclic aromatic hydrocarbons. The book ends with a summary of the key conclusions and recommendations. Together with the companion volume *Biogeochemistry of the Atmosphere, Ice and Water of the White Sea: The White Sea Environment Part I* it offers an essential source of information for postgraduate students, researchers and stakeholders alike.

The Micropalaeontology of Oceans B. M. Funnell, W. R. Riedel, 1971-06-02 This 1971 volume presents the proceedings of a Symposium of Micropalaeontology of Marine Bottom Sediments held in Cambridge England in September 1967 The collection and paleontological interpretations of deep sea sediments had only been carried out intensively for the twenty years preceding the book's publication and it provides a summary of the state of knowledge in this field as it stood Beginning with a consideration of the organisms in relation to the water in which they live successive chapters deal with the descent of the skeletons to the sea floor their entombment in the sediments and their interpretation to elucidate the history of the oceans It is written by many of the specialists responsible for the development of this field and includes numerous Russian contributions This book became the definitive compendium for students and workers in oceanography and palaeontology and is still a useful resource today

Advances in Geochemistry, Analytical Chemistry, and Planetary Sciences Vladimir P. Kolotov, Natalia S. Bezaeva, 2023-02-28 This book presents 41 selected articles written by leading researchers from the Vernadsky Institute of Geochemistry and Analytical Chemistry part of the Russian Academy of Sciences The articles are grouped by the following topics 1 Geochemistry 2 Meteoritics Cosmochemistry Lunar and Planetary Sciences 3 Biogeochemistry and Ecology and 4 Analytical Chemistry Radiochemistry and Radioecology The articles present recent experimental data theoretical investigations critical reviews the results of computer modeling in the above mentioned fields Intended to provide a scientific snapshot of the institute the book also includes content on its history main scientific achievements and current goals together with detailed descriptions of its 25 laboratories and three museums so as to promote new international collaborations Given its scope the book will be of interest to all scientists and graduate students working in the areas of geochemistry analytical chemistry and radiochemistry earth and environmental sciences biogeosciences meteoritics and planetary science and to those seeking new collaboration opportunities in these areas in Russia

Ambrose Jr., Anna Szaniawska, 2012-12-06 Oceanographic discontinuities e.g. frontal systems upwelling areas ice edges are often areas of enhanced biological productivity Considerable research on the physics and biology of the physical boundaries defining these discontinuities has been accomplished see I D The interface between water and sediment is the largest physical boundary in the ocean but has not received a proportionate degree of attention The purpose of the Nato Advanced Research

Workshop ARW was to focus on soft sediment systems by identifying deficiencies in our knowledge of these systems and defining key issues in the management of coastal sedimentary habitats Marine sediments play important roles in the marine ecosystem and the biosphere They provide food and habitat for many marine organisms some of which are commercially important More importantly from a global perspective marine sediments also provide ecosystem goods and services 2J Organic matter from primary production in the water column and contaminants scavenged by particles accumulate in sediments where their fate is determined by sediment processes such as bioturbation and biogeochemical cycling Nutrients are regenerated and contaminants degraded in sediments Under some conditions carbon accumulates in coastal and shelf sediments and may be removed from the carbon cycle for millions of years having a potentially significant impact on global climate change Sediments also protect coasts The economic value of services provided by coastal areas has recently been estimated to be on the order of 12.568×10^9 y 3J far in excess of the global GNP

This is likewise one of the factors by obtaining the soft documents of this **Sedimentation In The World Ocean** by online.
