Computational Auditory Scene Analysis David F. Rosenthal, Hiroshi G. Okuno, Hiroshi Okuno, David Rosenthal, 2021-02-01 The interest of AI in problems related to understanding sounds has a rich history dating back to the ARPA Speech Understanding Project in the 1970s While a great deal has been learned from this and subsequent speech understanding research the goal of building systems that can understand general acoustic signals continuous speech and or non speech sounds from unconstrained environments is still unrealized Instead there are now systems that understand clean speech well in relatively noiseless laboratory environments but that break down in more realistic noisier environments As seen in the cocktail party effect humans and other mammals have the ability to selectively attend to sound from a particular source even when it is mixed with other sounds Computers also need to be able to decide which parts of a mixed acoustic signal are relevant to a particular purpose which part should be interpreted as speech and which should be interpreted as a door closing an air conditioner humming or another person interrupting Observations such as these have led a number of researchers to conclude that research on speech understanding and on nonspeech understanding need to be united within a more general framework Researchers have also begun trying to understand computational auditory frameworks as parts of larger perception systems whose purpose is to give a computer integrated information about the real world Inspiration for this work ranges from research on how different sensors can be integrated to models of how humans auditory apparatus works in concert with vision proprioception etc Representing some of the most advanced work on computers understanding speech this collection of papers covers the work being done to integrate speech and nonspeech understanding in computer systems

The Perceptual Structure of Sound Dik J. Hermes, 2023-06-10 This book presents a comprehensive review of how acoustic waves are processed by the auditory system into structured sounds such as musical melodies speech utterances or environmental sounds After an introduction an overview is given of how the ears distribute acoustic information over a large array of frequency channels that contain the auditory information used by the central nervous system to generate a mental image of what is happening around the listener This process called auditory scene analysis consists of two stages In the first stage auditory units are formed such as musical tones and speech syllables Each auditory unit is perceived at a well defined moment in time the beat location of that auditory unit Moreover from this process of auditory unit formation the auditory attributes of these auditory units emerge such as their timbre their pitch their loudness and their perceived location Each of these attributes is discussed in the corresponding chapter In the second stage of auditory scene analysis auditory stream formation the successive auditory units are integrated into auditory streams i e temporally structured sequences of auditory units that are perceived as emanating from one and the same sound source Examples of such auditory streams are musical melodies and the utterances of one speaker The temporal structure of an auditory stream its rhythm is determined by the beat locations of its auditory units The role played by the auditory attributes of the consecutive auditory units is discussed

The melodies of musical streams and the intonation contours of spoken utterances emerge from this process In music the beats of parallel streams generally fit into a metric pattern and depending on harmony simultaneous tones can be perceived as consonant or dissonant Finally the book contains many sound examples including the MATLAB scripts with which they are generated

Readings in Multimedia Computing and Networking Kevin Jeffay,Hong Jiang Zhang,2001-08-10 Readings in Multimedia Computing and Networking captures the broad areas of research and developments in this burgeoning field distills the key findings and makes them accessible to professionals researchers and students alike For the first time the most influential and innovative papers on these topics are presented in a cohesive form giving shape to the diverse area of multimedia computing The seminal moments are recorded by a dozen visionaries in the field and each contributing editor provides a context for their area of research by way of a thoughtful focused chapter introduction The volume editors Kevin Jeffay and HongJiang Zhang offer further incisive interpretations of past and present developments in this area including those within media and content processing operating systems and networking support for multimedia This book will provide you with a sound understanding of the theoretical and practical issues at work in the field s continuing evolution Offers an in depth look at the technical challenges in multimedia and provides real and potential solutions that promise to expand the role of multimedia in business entertainment and education Examines in Part One issues at the heart of multimedia processes the means by which multimedia data are coded compressed indexed retrieved and otherwise manipulated Examines in Part Two the accommodation of these processes by storage systems operating systems network protocols and applications Written by leading researchers the introductions give shape to a field that is continually defining itself and place the key research findings in context to those who need to understand the state of the art developments

Computational Analysis of Sound Scenes and Events Tuomas Virtanen,Mark D. Plumbley,Dan Ellis,2017-09-21 This book presents computational methods for extracting the useful information from audio signals collecting the state of the art in the field of sound event and scene analysis The authors cover the entire procedure for developing such methods ranging from data acquisition and labeling through the design of taxonomies used in the systems to signal processing methods for feature

extraction and machine learning methods for sound recognition The book also covers advanced techniques for dealing with environmental variation and multiple overlapping sound sources and taking advantage of multiple microphones or other modalities The book gives examples of usage scenarios in large media databases acoustic monitoring bioacoustics and context aware devices Graphical illustrations of sound signals and their spectrographic representations are presented as well as block diagrams and pseudocode of algorithms Special Issue on Computational Auditory Scene Analysis Martin
