Long Term Durability of Structural Materials P.J.M. Monteiro,K.P. Chong,J. Larsen-Basse,K.

Komvopoulos,2001-08-29 Long Term Durability of Structural Materials features proceedings of the workshop held at Berkeley CA in October 2000 It brought together engineers and scientists who have received grants from the initiative NSF 98 42 to share their results on the study of long term durability of materials and structures The major objective was to develop new methods for accelerated short term laboratory or in situ tests which allow accurate reliable predictions of the long term performance of materials machines and structures To achieve this goal it was important to understand the fundamental nature of the deterioration and damage processes in materials and to develop innovative ways to model the behavior of these processes as they affect the life and long term performance of components machines and structures The researchers discussed their approach to include size effects in scaling up from laboratory specimens to actual structures Accelerated testing and durability modeling techniques developed were validated by comparing their results with performance under actual operating conditions The main mechanism of the deterioration discussed included environmental effects and or exposure to loads speeds and other operating conditions that are not fully anticipated in the original design A broad range of deterioration damage such as fatigue overload ultraviolet damage corrosion and wear was presented A broad range of materials of interest was also discussed including the full spectrum of construction materials metals ceramics polymers composites and coatings Emphasis was placed on scale dependence and history of fabrication on resulting mechanical behavior of materials

Cho,2013-10-02 Proceedings of the Fourth International Conference on Durability of Building Materials and Components

Volume I contains the proceedings of the Fourth International Conference on Durability of Building Materials and Components held in Singapore on November 4-6 1987. The conference provided a forum for reviewing advances that have been made with regards to the durability of building materials and components and tackled topics ranging from concrete materials and structures to fiber reinforced concrete, plastics, surface coatings and building codes and specifications. Comprised of 67 chapters, this volume first summarizes the technical barriers to service life prediction and outlines research directions for overcoming such barriers. The discussion then turns to the deterioration of slate tiles containing iron sulfides, prediction of durability of building sealants and the durability of building ceramics in agricultural environments. Subsequent chapters focus on the influence of seawater curing on the pore structure of flyash blended cement mortar, effect of cement composition on the durability of natural fibers in mortar, permeability control of concrete protective layers in products and theory and experimental evidence concerning maximum and minimum strength of composite materials. The applications of surface integral techniques to fracture analysis are also considered. This book will be of interest to practitioners and research workers in engineering.

PCM-Enhanced Building Components Jan Kośny, 2015-05-07. Presenting an overview of the use of Phase Change Materials (PCMs) within buildings, this book discusses the performance of PCM enhanced building envelopes. It reviews the most common PCMs suitable for building applications and discusses PCM encapsulation and packaging methods. In addition to this, it examines a range of PCM enhanced building products in the process of development as well as examples of whole building scale field demonstrations. Further chapters discuss experimental and theoretical analyses including available software to determine dynamic thermal and energy performance characteristics of building enclosure components containing PCMs and present different laboratory and field testing methods. Finally, a wide range of PCM building products are presented which are commercially available worldwide. This book is intended for students and researchers of mechanical, architectural and civil engineering and postgraduate students of energy analysis, dynamic design of building structures and dynamic testing procedures. It also provides a useful resource for professionals involved in architectural and mechanical/civil engineering design, thermal testing and PCM manufacturing.

The International Handbook of FRP Composites in Civil Engineering Manoochehr Zoghi, 2013-09-26. Fiber reinforced polymer (FRP) composites have become an integral part of the construction industry because of their versatility, enhanced durability and resistance to fatigue and corrosion, high strength to weight ratio, accelerated construction and lower maintenance and life cycle costs. Advanced FRP composite materials are also emerging for a wide range of civil infrastructure applications. These include everything from bridge decks, bridge strengthening and repairs and seismic retrofit to marine waterfront structures and sustainable energy efficient housing.
