Combinatorial Inference in Geometric Data Analysis Brigitte Le Roux, Solène Bienaise, Jean-Luc Durand, 2019-03-20 Geometric Data Analysis designates the approach of Multivariate Statistics that conceptualizes the set of observations as a Euclidean cloud of points Combinatorial Inference in Geometric Data Analysis gives an overview of multidimensional statistical inference methods applicable to clouds of points that make no assumption on the process of generating data or distributions and that are not based on random modelling but on permutation procedures recasting in a combinatorial framework It focuses particularly on the comparison of a group of observations to a reference population combinatorial test or to a reference value of a location parameter geometric test and on problems of homogeneity that is the comparison of several groups for two basic designs These methods involve the use of combinatorial procedures to build a reference set in which we place the data The chosen test statistics lead to original extensions such as the geometric interpretation of the observed level and the construction of a compatibility region Features Defines precisely the object under study in the context of multidimensional procedures that is clouds of points Presents combinatorial tests and related computations with R and Coheris SPAD software Includes four original case studies to illustrate application of the tests Includes necessary mathematical background to ensure it is self contained This book is suitable for researchers and students of multivariate statistics as well as applied researchers of various scientific disciplines It could be used for a specialized course taught at either master or PhD level

Geostatistics Banff 2004 Oy Leuangthong, Clayton V. Deutsch, 2008-01-24 The return of the congress to North America after 20 years of absence could not have been in a more ideal location The beauty of Banff and the many offerings of the Rocky Mountains was the perfect background for a week of interesting and innovative discussions on the past present and future of geostatistics The congress was well attended with approximately 200 delegates from 19 countries across six continents There was a broad spectrum of students and seasoned geostatisticians who shared their knowledge in many areas of study including mining petroleum and environmental applications You will find 119 papers in this two volume set All papers were presented at the congress and have been peer reviewed They are grouped by the different sessions that were held in Banff and are in the order of presentation These papers provide a permanent record of different theoretical perspectives from the last four years Not all of these ideas will stand the test of time and practice however their originality will endure The practical applications in these proceedings provide nuggets of wisdom to those struggling to apply geostatistics in the best possible way Students and practitioners will be digging through these papers for many years to come

High-dimensional Microarray Data Analysis Shuichi Shinmura, 2019-05-14 This book shows how to decompose high dimensional microarrays into small subspaces Small Matryoshkas SMs statistically analyze them and perform cancer gene diagnosis The information is useful for genetic experts anyone who analyzes genetic data and students to use as practical

textbooks Discriminant analysis is the best approach for microarray consisting of normal and cancer classes Microarrays are linearly separable data LSD Fact 3 However because most linear discriminant function LDF cannot discriminate LSD theoretically and error rates are high no one had discovered Fact 3 until now Hard margin SVM H SVM and Revised IP OLDF RIP can find Fact3 easily LSD has the Matryoshka structure and is easily decomposed into many SMs Fact 4 Because all SMs are small samples and LSD statistical methods analyze SMs easily However useful results cannot be obtained On the other hand H SVM and RIP can discriminate two classes in SM entirely RatioSV is the ratio of SV distance and discriminant range The maximum RatioSVs of six microarrays is over 11 67% This fact shows that SV separates two classes by window width 11 67% Such easy discrimination has been unresolved since 1970 The reason is revealed by facts presented here so this book can be read and enjoyed like a mystery novel Many studies point out that it is difficult to separate signal and noise in a high dimensional gene space However the definition of the signal is not clear Convincing evidence is presented that LSD is a signal Statistical analysis of the genes contained in the SM cannot provide useful information but it shows that the discriminant score DS discriminated by RIP or H SVM is easily LSD For example the Alon microarray has 2 000 genes which can be divided into 66 SMs If 66 DSs are used as variables the result is a 66 dimensional data These signal data can be analyzed to find malignancy indicators by principal component analysis and cluster analysis
