*MRI Contrast Enhancement in the Central Nervous System* Robert C. Brasch, Burton P. Drayer, 1993      **MRI Contrast Enhancement in the Central Nervous System** Robert C. Brasch, 1993      **Advances in Imaging Techniques in Ischemic Heart Disease** Ernst E. van der Wall, Thomas H. Marwick, Johan H. C. Reiber, 2012-12-06

In recent years there have been tremendous advances in cardiac imaging techniques covering the complete spectrum from echocardiography nuclear cardiology magnetic resonance imaging to contrast angiography With respect to these noninvasive and invasive cardiac imaging modalities marked technological developments have allowed the cardiologist to visualize the myocardium in a far more refined manner than conventional imaging was capable of Echocardiography has extended its domain with intravascular ultrasound cardiovascular nuclear imaging has added positron emission tomography to its line of research magnetic resonance imaging has been broadened with magnetic resonance angiography and spectroscopy and finally contrast angiography has widened its scope with excellent quantitation programs For all these imaging modalities it is true that the application of dedicated quantitative analytic software packages enables the evaluation of the imaging studies in a more accurate reliable and reproducible manner It goes without saying that these extensions and achievements have resulted in improved diagnostics and subsequently in improved patient care Particularly in patients with ischemic heart disease major progress has been made to detect coronary artery disease in an early phase of the disease process to follow the atherosclerotic changes in the coronary arteries to establish the functional and metabolic consequences of the luminal obstructions and to accurately assess the results of interventional therapy

**Methods in Biomedical Magnetic Resonance Imaging and Spectroscopy** Ian Robert Young, 2000 These volumes are an abstraction from the Encyclopedia of Nuclear Magnetic Resonance of articles concerned with magnetic resonance imaging and spectroscopy The volumes cover imaging in all its forms and spectroscopy in as far as it relates to in vivo studies and clinical applications involving in vitro investigations of tissue The various articles which comprise these two volumes are organised into topic based sections Some of the articles appear as they were originally presented in the Encyclopedia where there is little new information and some have been more or less substantially revised in the light of what has happened since the articles were first written A number of new articles have been added where topics have either developed from fragmentary discussions in the early 1990s or have been created ab initio since the publication of the Encyclopedia These extensive volumes are unique in their coverage with a balance between imaging physics spectroscopy and clinical studies In many ways they reflect the scope covered by the major international in vivo NMR Societies with a conscious effort to allow the reader to understand all the elements that make up modern clinical magnetic resonance Equally the topic is so huge and still evolving so fast in detail rather than concept that they can act as no more than an introduction though at quite a demanding level The reader will appreciate the extent nature and dynamics of human and animal magnetic resonance and will have the route map to allow them to find any further

*Application and Reliability Assessment of Next Generation Sequencing (NGS) and targeted NGS (tNGS) in the Diagnosis of Infectious Diseases, volume III* Li Ang, Xin Zhou, Beiwen Zheng, Yair Dorsett, 2025-06-18

Given the success of Improving the Clinical Effectiveness of Metagenomic Next Generation Sequencing (mNGS) in Infection Disease Diagnosis and Treatment Linking the NGS Specialists and Clinicians series of article collections and the rapidly evolving subject area, we are pleased to announce the launch of Volume III. Rapid and accurate diagnosis is crucial for the effective treatment of infectious diseases. Metagenomics using next generation sequencing (NGS) or targeted NGS (tNGS) by enriching and sequencing specific regions of microbial genomes can directly analyze mixed genomic materials from bacteria, viruses, fungi, parasites, and hosts in clinical samples. This provides immense potential for cost reduction and faster turnaround times ranging from 12 to 24 hours without the need for a clinical hypothesis. Although NGS still faces technical and practical challenges, it has been used in clinical practice, especially for critically ill patients in intensive care units who show no response to anti-infective therapies. At this stage, it is crucial to focus

on the accuracy of pathogens identification in NGS reports for downstream clinical decision making such as adjusting anti infective therapies or excluding infectious diseases in cases with negative reports Therefore the specificity of the reported pathogens should be comprehensively assessed by combining multiple clinical tests and processes
