

Step 1:

All protons become aligned with the net magnetization or B_0 .

Step 2:

RF excitation pulse is applied to the aligned protons.

Step 3:

Aligned proton become excited by RF pulse and flips into the transverse plane.

Step 4:

RF pulse ends and the net magnetization begins to relax and return to the longitudinal plane.

Review Questions for MRI Carolyn Kaut Roth, William H. Faulkner, Jr., 2013-05-22 Magnetic Resonance Imaging MRI is the fastest growing modality in diagnostic imaging There are now thousands of MRI facilities across the United States and around the world employing huge numbers of technologists The American Registry of Radiologic Technologists has with the help of experts in the MRI and educational fields devised a multiple choice examination that is intended to ensure that all technologists have the required level of knowledge to practice MRI safely and competently Carolyn Kaut and William Faulkner experts in the field of MRI education have compiled this book to help students prepare for the registry examination The questions follow the structure of the syllabus and are intended to help readers test their understanding of the subject and identify any gaps in their knowledge The book is

extremely comprehensive covering all the aspects of the examination including patient care and safety imaging procedures pulse sequences and data acquisition and imaging artifacts and options **Totally Accessible MRI** Michael L.

Lipton, 2010-04-28 BSD All magnetic resonance technologists and all radiologists who work with magnetic resonance MR technology can be divided into two subgroups 1 those who understand the underlying physics principles and how to apply them and 2 those who do not For so many patients and for so many diagnostic considerations the difference between membership in these two groups is minimal One can easily diagnose a vestibular schwannoma and accurately differentiate it from a cerebellopontine angle meningioma without being that well versed with many of the concepts underlying the creation of the MR images on which these tumors are depicted One by rote can generate images of the pelvis that are quite diagnostic and aesthetically pleasing without really understanding the intricate interrelationships between the varying imaging parameters used in the generation of the obtained image contrast There are certain situations however for which a more in depth understanding is required For example Seeing tissue signal disappear on a short T1 inversion recovery sequence yet recognizing that it does not have to originate from fat but may come from methemoglobin or some other short T1 tissue may prove clinically vital for arriving at the correct diagnosis For such circumstances understanding the underlying principles that govern the creation of the image and the contrast contained therein is critical and sets one apart and distinctly ahead of the competition who cannot make this claim
