Sectional Anatomy of the Head and Neck John H. Lillie, Brent A. Bauer, 1994 This superb atlas of the sectional anatomy of the head and neck exclusive of the CNS is presented in two complementary planes coronal and horizontal Sixty four exceptional pen and ink illustrations accurately capture the fine detail of 3mm thick sections through the region Every detail was exactly transferred from photographs of the section and its identification was confirmed by microdissection of the exposed surface These pen and ink images have been reproduced at natural size in labeled and unlabeled pairs an approach that allows the complete identification of structures without masking critical anatomical detail The captions that accompany each set of illustrations provide brief authoritative information about the section and how it relates to adjacent tissues Difficult concepts such as regional compartments and facial spaces are clearly

explained reflecting the broad experience of the senior author in teaching the basic as well as the applied clinical anatomy of the head and neck Twenty two sections have been selected for radiographic imaging These high resolution radiographs portray planar detail at a level which closely simulates that revealed by high quality CT images of the region Introductory chapters review the history of sectional anatomy and provide a unique overview of the fundamental organization of the head and neck They enhance the value of an atlas that will guide the student and clinician through a sequential study of this anatomically intricate region and will aid radiologists in interpreting bony images and relating them to the soft tissues which surround them

Cancer Surgery Nirav Trivedi, 2014-12-03 Surgery for head neck cancer has evolved greatly in the recent years. Appropriate surgical resection with negative margins still remain corner stone in achieving good oncological outcome. This atlas proposes a new concept of The Compartment Surgery to achieve negative margins in third dimensions which is the problem area in majority of cases. Reconstructive techniques have evolved vastly in the recent years with use of microvascular free flaps and this has significantly improved the functional outcome. Performing each step in appropriate manner cumulatively enables us to perform more complex procedures. Theme of this atlas revolves around this fact. This atlas on head and neck cancers takes a fresh stylistic approach where each surgical procedure is described in a step wise manner through labeled high resolution images with minimal incorporation of text. This allows the surgeons to rapidly revise the operative steps of a procedure within minutes just before they start a surgery. Head and neck has multidimensional anatomy and surgical treatment requires specific approach for each subsite. This operative atlas covers the entire spectrum of common uncommon and rare cancers of the head and neck area. Each subsite is addressed in a separate chapter with further subdivisions for surgery of tumors with varying extent. Each procedure is demonstrated with photographs of each surgical step and line diagrams. Commonly used flaps regional and free flaps are demonstrated in separate chapter for reconstruction. With over 1000 images and coverage of both the ablative and reconstructive surgical procedures this is a technique focused atlas in comparison to the available comprehensive texts. There are two chapters on very advanced cancers and surgery in resource constrained surgical units making the book relevant to a wide range of cancer surgeons and fellows in training in varied clinical settings. *Chest Atlas* Mary L. Durizch, Jesse T. Littleton, 2012-12-06 Chest Atlas Correlated Thin Section Anatomy in Five Planes is a highly accurate definitive anatomic reference of the chest. Anatomic specimens and specimen radiographs were obtained from fresh frozen cadavers whose lungs were re inflated to render the most accurate life like representation possible. The authors then meticulously matched computed tomography trispiral tomogram and magnetic resonance images of normal subjects to the corresponding anatomic section. A plain film radiograph of each section completes the correlation between cadaver and clinical imaging techniques. Each section from each plane is displayed on a two page spread containing the labeled anatomic specimen in full color, the anatomic key and the radiographic images thus facilitating the correlation of the anatomic specimen and radiographs. The reader's understanding is also enhanced by fresh frozen cadavers meticulously prepared and sectioned. Sectioning of all planes axial coronal sagittal left oblique and right oblique retention of normal tissue color section keys to keep the reader oriented uniform labeling key throughout the book state of the art clinical images precisely correlated to the cadaver sections. This atlas will be especially useful to radiologists surgeons and chest physicians who seek a definitive reference source on normal chest anatomy. This book will be an invaluable reference source for correlating diagnostic images with clinical findings.
